There is someone who occasionaly posts to this group who takes donations
of old books, scans them and makes them available for free download.

I like to suggest than instead of selling them, you donate them to him.

Geoff.

I'd test them... if they seem okay in-circuit, leave them there.  If down
the road one of them fails, replace them all.

Contact the guys at www.odometergears.com.  They can make a mold from
the broken original and stamp you out a new delrin one.

    Thanks, I'll check it out. I used to know a finemechanic
who could have machined one of brass in a minute but he's
dead now.
    Getting at this thing looks to be a major job, not
looking forward to it.

Does some one have a diagram of the tube locations for a Breting 14? I would appreciate saving the time of ferreting out the schematic against the sockets.

Thanks,
Paul P.

Richie, The RBS and the RBM both had their respective LF and MF
versions in each dash series. Hopefully, the table below will come
across OK.

RBM,-1,2,3	Medium Frequency Receiver	CCT-46076
RBM-4	Medium Frequency Receiver	CCT/CAY-46076
RBM-5	Medium Frequency Receiver	CAY-46076-A
RBM, -1,2,3	High Frequency Receiver	CCT-46077
RBM-4	High Frequency Receiver	CCT/CAY-46077
RBM-5	High Frequency Receiver	CAY-46077-A
RBS-1	High Frequency Receiver	CCT-46217
RBS-1	Medium Frequency Receiver	CCT-46216
RBS-2	High Frequency Receiver	CCT-46217-A
RBS-2	Medium Frequency Receiver	CCT-46216-A

I have a number of 6146s that I know I'll never use in the future and would like to sell them to someone who will, or wants spares.

All used, many known to be good from prior use or users. Couple in original boxes. Might be one 6146a, one 6146w. If this is important, let me know.

$3.00 money order per each, plus postage (USPS).

$2.50 each for all to one buyer.

Respond to the given email address associated with this post (its live but has spam assasin set up so don't talk too much commercialism or it might get bombed to /dev/null). If I don't respond in a day, then make a post responding to this and give your munged email address and I'll get back to you.

Hi Jeep;
Tnx for that info.
```

Why did they make everything so complicated, hi!
There must not be many around because I have never seen any except the one I have.
Been interested in old BA's since 1960, only one i've seen is mine:-)
73.......
Rich

The outdoor PvP objectives in the zone of Nagrand involve the town of Halaa If you don't control that town, if your faction doesn't control that town then you'll have PvP objectives to kill the guards and whatnot and part of that will involve strafing runs over the town 'on rails' where you'll drop bombs. That should be fun.'GuildWars Gold' (http://www.wowgold247.com/GuildWars-Gold.html)'Guild Wars Gold' (http://www.wowgold247.com/GuildWars-Gold.html)'KAL Geons' (http://www.wowgold247.com/KALOnline-Geon.html)'KAL Online Geons' (http://www.wowgold247.com/KALOnline-Geon.html)'KAL Online Gold' (http://www.wowgold247.com/KALOnline-Geon.html)

I have an RBM-5 high-frequency receiver. Never thought of it as being any more rare than, say a TCS-12 set. Are they? Or maybe you're referring to the RBS...

Mine was one of the first decent SWL radios I ever got, back in high school. It was immediately preceeded by an RAO-3 (NC-100, sorta). Still have them both, and wouldn't part with either, although it's been so long since either one has been powered up that I'd need to recap them first. I lost the power transformer in a low-freq RAL-7 supply a few years ago for failing to do that. I miss the blue glow of the giant ballast tube in that one :)

Dale

These receivers seem to appear in batches. I acquired 6 of them over about an 18 month period via the hamfests and Ebay. Four of them were RBMs and two where RBSs. I have kept a complete RBM setup with racks, power supplies, and the receiver/transmitter control box. What I didn't know was there was the RBS-3 version until late in my collection. The very late models were made by a third company, the name of which slips my mind. The cases were a two-tone affair; gray with black panel overlay. Some Navy overhauled units were also painted gray and had Type N antenna connectors installed. Those with SO-239s are Ham mods, for sure. Having said all the above.... I've only seen a couple on Ebay and none at the hamfests in the past several years

I believe the trouble is in the T/R circuit of the 6EV7 tube.. Check
the tube first ,then notice that there are several High Ohm resistors
associated with this circuit,like I megohm and higher.These high ohm
resistors will age and increase in value almost to an open
condition.Change ALL of these.This is a frequent problem with Drake
s.. GL   Harold W4PQW

I just finished repairing an SB-301 receiver. It works well, however, I can=92t reliably calibrate the dial. For example, if I zero the dial at, say, 3.5 Mhz using the internal 100 Khz crystal oscillator, the needle is about 4 Khz too high at 3.6, 3.7, 3.8 and 3.8 Mhz, but is again zeroed at 4.0 Mhz. Is this normal behavior for linear master oscillators (LMOs)?

NOTE: This LMO needed to be repaired. Two of its tabbed slip rings on the tuning shaft were =93glued=94 together (hardened grease) and its capacitor plates moved beyond the fully meshed position on the low end of the tuning range. Anyhow, I removed and cleaned the slip rings and adjusted the rotation offset of the tuning capacitor. I=92m now left wondering if, out of necessity, I fouled up the LMO=92s calibration.

This is a manageable shortcoming, as I can calibrate to the nearest 100 Khz mark. Nevertheless, I=92m curious if such variability is normal.

I just finished repairing an SB-301 receiver. It works well, however, I can�t reliably calibrate the dial. For example, if I zero the dial at, say, 3.5 Mhz using the internal 100 Khz crystal oscillator, the needle is about 4 Khz too high at 3.6, 3.7, 3.8 and 3.8 Mhz, but is again zeroed at 4.0 Mhz. Is this normal behavior for linear master oscillators (LMOs)?

NOTE: This LMO needed to be repaired. Two of its tabbed slip rings on the tuning shaft were �glued� together (hardened grease) and its capacitor plates moved beyond the fully meshed position on the low end of the tuning range. Anyhow, I removed and cleaned the slip rings and adjusted the rotation offset of the tuning capacitor. I�m now left wondering if, out of necessity, I fouled up the LMO�s calibration.

This is a manageable shortcoming, as I can calibrate to the nearest 100 Khz mark. Nevertheless, I�m curious if such variability is normal.

-Dave Drumheller, K3WQ

LMOs (or PTOs) are never perfect and a +/- 1kHz error, or even a little more, is normal.

+/- 2kHz, as in your case, is probably on the high end.

But hard to tell how you can improve linearity any further.

Obviously it would be better to tune the oscillator so that it is at -2kHz on 3.5 and 4 MHz, and at +2KHz on 3.6, 3.7 and 3.8 MHz. Or even better at -3kHz on 3.5 and 4 MHz, and at +1KHz on 3.6, 3.7 and 3.8 MHz, so that you are closer to true frequency on the major part of the scale without recalibration.

Hi Dave:

First, let me say I have not played with the Heath LMO alignment for decades and
I do not remember specifics. But, here are things I would do - not necessarily in order.

1. Draw a graph of the LMO error so that you have a visual representation of the error. It may be that the error is simply occurring at one end, which could mean that a mechanical shift of the plates could accomplish your goal.

2. Most capacitors in receivers generally have tabs on the outside plate divided into sections that can be bent to facilitate adjustment. You sometimes can make minor physical admustments even without the plates that are divided with slots.

3. A trick to reduce the end error is to align for a point in from the end, such as 3.6 and 3.9 MHz. Track the error. Then, try 3.55 and 3.95 and track the error. You might be able to find a compromise you can live with.

4. You can physically take a Dremel tool and custom shape the outside rotor or stator to give you the curve you desire. This requires careful documentation of the shift. A computer graph made by a spreadsheet works great.

With patience and care, you should be able to get it right on the button.

73, Colin K7FM

The LMO was spec'd to be +/- 2KHz from end to end. So, set it to be dead on at the middle of the band, and it should be fine.

Try googling on Heath LMO recalibration... You should find some instructions on how to clean your LMO up, and recalibrate it for best linear operation.

Thanks to Phil Nelson and many others for great internet
documentation and numerous usenet posts regarding the SX-28. I
followed Phils RF deck instructions and re-capped my radio, which is
currently still on the bench. I also have a sx-28 parts radio which
has been invaluable
for various mechanical repairs. Even after re-alignment, the radio
still needs help, however. It has a mod using a 6sn7 where the 6j5
should be, along with an internal switch. I'm guessing it is a product
detector, and I'm having so much trouble with this radio with AVC
problems and intermittent sensitivity, and s-meter issues, that I've
decided to restore the original detector with a 6j5 and try to rebuild
the section using the schematic and the parts deck as a guide. It is
an intimidating undertaking, though. The schematic shows no pin
numbers for the tubes, and the wire re-tracing is tough, since their
color coding is long gone. I'm considering buying another working
radio to use as a guide, and then when I finally have two working
sx-28's, I'll sell one of them off. However, I'm sure there are enough
production variances to not completely rely on the copy. After
numerous successful restorations on other radios, this one's been an
abyss that I seem to be falling into far deeper. Any old articles on
product detector mods for the sx-28 would be great to read to assist
in un-modding this thing!
Thanks!
Ben

I've never attempted something so complex as a complete rebuild of an
SX-28; but I'd suggest you go through the schematic with a tube manual
and mark all those pin numbers as a first step.....

Thanks, everyone, for your advice.

If I spot the 100 kHz crystal oscillator at 3.7 MHz, I have no more than 2.5 kHz of error across the band, which is a bit high, but acceptable, so I=92ll leave it alone for now. If I do attempt to reduce the dial error, I=92ll try bending the tabs on the variable cap. I=92ll first attempt to do this while the LMO is still installed in the receiver. This will require a dental mirror and pick, but may just work.

Hi Chuck!!
        I've fixed several of these over the years, and what I've found
is that the ground wiper on the capacitor gets dirty (see Bill Turners
response).  I'll expand on what Bill said.  These things tend to lose
their ground and if it's real bad, you'll get a "warble" when you tune
the radio across the band.  If you partially disassemble the LMO, you
can get to the cap and clean and regrease it, and then you can get to
the adjustments inside to be able to re-linearize the thing.  I've
gotten many of them to track almost as close as a Collins PTO, easily
less than 1/2 kHz off per 100 kHz.  You'll find that TRW used low value
caps to pad the things and usually very little actual repair of them is
needed.  FYI, you WON'T find any good info on the thing because Heath
didn't want you inside of it in the first place.  Draw a schematic so
you have something to work from.

Hi Kim,

The schematic for the solid state LMO is on bama in the Heath section.

Heath may have not wanted people inside of the LMO, but in the later years, many an adventurous soul went in anyway.

-Chuck

I have heard that there are very few electrolytic capacitors in this machine, as most of them are ceramic disk. The only ones are in a can on the chassis. If the radio is working well as original, would it be better to just leave well enough alone? I always try to live by the maxim: If it ain't broke.....
Thanks,

Bob Grimes

Find something else that is broken and needs fixing.

You have a problem - you do not have enough radios that need repair. In short, you have not done your part to rescue old radios.

Once you have a pile of old radios that do not work, because someone twisted all the if adjustments until they failed, or used Windex to clean all the lettering off the dial, you will not have enough time to recap a radio that is working fine.

In fact, you will not even have room on your bench for a working radio, nor have time to enjoy them.

Colin K7FM

What the hell are you talking about? I have two old radios that I
recapped: an S-38 and an HE-10. I was told by several boatanchor
owners that this particular Hammarlund would not need a recap as most
of them were ceramic disk with no black beauties. What are you on?
This sounds like some rant against the man? I just wanted good radio
advice!

Hello Randy
Have had good results with gloss black two pack automotive paint such as
Acran. It is a bit expensive here but seems to be both good looking and wear
resistant. Have also used it with many coats to replace that plastic dip
that is used on aircraft control yolks

I am not sure how a synchonous detector works with
suppressed carrier SSB but my understanding of it may be

incorrect. To me a synchronous detector is a device for replacing the carrier of a double sideband signal, either AM or suppressed carrier and synchronized by means of the equal and opposite phase of the two sidebands. Such a detector will supply a locally generated carrier which has exactly the right phase with relation to the sidebands even when they are distorted by selective fading. Similar detectors are also used for television where there is a residual carrier and sideband since that is enough to lock the oscillator to the correct frequency and phase.

Beam switching tubes were used to some extent in commercial vacuum tube equipment but Hallicrafters transmitters are the only example with come to mind at the moment, I am sure there were others. These things came along at about the same time that transistors began to supplant tubes.

As far as selectable sideband in an SSB adaptor AFAIK all worked by means of either shifting the signal to the filter frequency or having two filters. I don't see how phasing would work in a receiving adaptor. There were numerous phasing type SSB generator for transmitting, for instance the one made by Barker and Williamson who also made 90degree audio phase shifting networks for use in home made ones. I still have the B&W adaptor I used in the 1960s. It worked pretty well but had to be adjusted for any large frequency change. Stable high performance filters or reasonable cost pretty much ended the use of phasing type exciters.

In any case, a good performing receiving adaptor which would work on older receivers, especially tube receivers, would be welcome. The old Hammarlund and TMC units are pretty hard to come by and, I suspect, something modern would outperform them.

The Central Electronic Sideband Slicer used phasing for SSB reception.
```

On the other hand, the B&W 370 used the filter method.

Pete

  I found the handbook for the CE box on BAMA and will have
a look at what they are doing.

I just polished some up with the plastic polish and it really came out nice, maybe a little too nice. It looks like a brand new knob on 50 year old equipment. I would like something that gets the dirt off but leaves a little age.

Jimmie

Does anyone have the mike pinout for the Icom IC-22A?
It is a crystal-controlled rig that lacks the original mike (a 4 pin job).
I have a few spare mikes but am having trouble figuring out the pin assignments.
any help appreciated
thanks

Does anyone have a small PM speaker...no more than 1.59-inches in diameter
and 3/8-inch deep that would fit inside a vintage Brush headphone? Ideally I
would like to find a high impedance (30K ohms on up) earphone cartridge but
can probably make a small speaker work for the purpose I need it.

Thanks.

Go to the dollar store and get a pair of disposable Walkman headphones.

If you want high-Z, have you considered using a crystal microphone in reverse?
Digi-Key should have some cheap crystal mike elements.  They won't sound as
good as a disposable Walkman headphone, though.  But they won't sound any
worse than the originals.

For all my old equipment, I remove the knobs and any screws, then give
them a good cleaning with a tooth brush in warm, soapy water. I use a
mild liquid soap like used to wash cars. They come out very nice
without being "too nice."

Dick

Scott,

Thanks. I like this idea. Between Andrew in Australia and your suggestion I discovered I had "Goodwilled" my old cell phone but I had a crummy Walkman headphone (with only one side working) in the bottom of a drawer.

I appreciate your taking the time to suggest it!

Smokey

Hi,

The Central Electronics Slicer was based on the GE Signal Slicer,
which appeared in GE Ham News, July-Aug 1951.

BANA has the issue, under the category gehamnews,  filename ge0604.pdf

The GE article shows how to build it, including the the 90 degree
audio phase shift network.  It's pretty slick -
a selectable sideband adapter based on a phase shifting circuit,
for any 450kc to 500kc i.f. receiver.

73,
Ed Knobloch

Late 2007 early 2008. All the way from North America to the Middle East, through security in three major airports etc.

Then Malta for 8 days and back to M.E. Through security again, in six airports. No problems.

In some airports a belt buckle or metal eye-glasses would activate the metal scanner and in others nothing seemed to do so. Some required one to remove shoes, some did not.

Then before boarding a twenty minute hop between two airports within the M.E. my pocket neon test screwdriver, with a blade all of two inches long, was confiscated! "Not allowed"!

Any idea of where to acquire another one? Preferably cheap! Also do some have a resistor in series with the little NE-2 type neon; but others not?

P.S. Rather interesting is that on one leg of one flight we were served a meal, complete with 'metal' knife and fork. This was a nice airline, but wasn't in business class; just back in steerage. Estimate blade of that knife was longer than my later confiscated pocket screwdriver, which had been tucked into a row of pencils/pens in my brief case for many years including three other international trips, 2005 to 2008.

Certain lack of security consistency; eh?

Terry,

Isn't it absurd?

Anyway, if you are looking for the little 120VAC voltage testers in a pen case I have seen them at Ace Hardware stores. I have also seen them at another store that is about 2 hours away but only get there about 3 times a year (thank you, Exxon). If you can't locate one drop me an email and I will keep you posted on my next trip to that store in the next few months.

Good luck.

Smokey

It's a tool. You aren't allowed to have tools on US airliners. They took my Allen wrench away. When I asked, I was told that I could use it to take the plane apart. I pointed out that we were flying on an Airbus which is all metric, but it didn't help.

As far as I know, they all have a resistor in series, because without it they could not be used on the 110V AC line.

What you want is a Blackburn 19-079. Wesco carries it, so does Tristate Electrical Supply. Ask your local Graybar if they carry the Blackburn tools.

The War On Liquids isn't about actual security, it's about annoying customers so they feel like Something Is Being Done.

What airline gave you metal utensils? US airlines don't even serve you meals any more, as far as I can tell...

Tools (not defined) and screwdrivers less than 7" long are allowed
in carry-on bags.

http://www.tsa.gov/travelers/airtravel/prohibited/permitted-prohibited-items.shtm#7

However:

too bad you didn't have a micrometer on hand to prove the size...but
then they would have taken it, too. It really would suck if they
allowed an Allen wrench on board, and some fool took the wings off the
plane while it was en route. <g>

I was in line for security in Vegas last year. When I opened my
carry-on to pull out the laptop, I realized I had packed a little cheap
'computer tool kit' in there, rather than in my checked luggage. I
simply tossed it in the trash. I wasn't going to give them the
satisfaction of taking it from me (and getting to keep it), or an
opening to hassle me any more than usual.

I think it's an agreement between them and the airport vendors. Throw
your water away at the gate, and buy more on the other side.

The reason I said either slicer or ssb adapter is as follows:

A slicer allows one to copy and select the sideband
on an older receiver such as the Hammarlund 129X.
The most prominent slicer was amde by Central Electronics there were two versions, one just a slicer and another with a Q Multiplier which was usually missing from older receivers. There were several other slicers on the market. I had one called a VR
made in New England. RME made one to match the 4300/4350 receivers. This was the only one that did not match 455 kcs IF's.

The best example of the ssb adapter was the Hammarlund HC-10 which added another IF plus a slot and pass band filter. The SPC-10 was exactly the same except sold to the DOD for six times as much as the HC-10. Frank Lester (SK) designed these and helped incorporate them into several of the Hammarlund receivers. TMC and several others made ssb adapters, too.

Both the slicer and SSB adapters made copying CW better too.

Dave K4JRB   and still looking!

The B&W 370 includes a SSB crystal filter.

I have a real close friend that was a pilot for USAir.
One day he was going through security and they took
out his fingernail clippers from his flight bag
and broke the nail file off and handed it back to him.
Now understand that this guy was fixing to climb into
the cockpit and fly the plane, but his fingernail file
was dangerous...

He got furlowed not long after that and he was glad.

Those radios have a 455 if output to connect to that adapter.

Could be but I don't think that Arab bureaucrat would have known how
to use it.
Also the voltage 'over there' is 230 volts (50 hertz) so my 115 volt
would certainly 'fire' just through body capacity of an individual
using it!

Yes water! Must be hazardous? Was given a bottle just before landing
in London UK, arriving from the middle east. Not allowed to take it
through the re-security check in the transfer line! Had to drink it in
the presence of the security guy, while we had a most pleasant chat
about our respective growing up some 40 to 50 years ago. Apparently it
ceased to be hazardous down my gullet!

No. It wasn't a North American airline that served that meal it was
IIRC Emirates Air out of Abu Dhabi etc. Very nice service from an
international crew, good planes etc.

Thanks for the leads on finding another neon pocket tester. Terry

I am getting a Hammarlund HQ-145 and would like to get some of the
groups opinions on the radio, compared to the competition at the time.

 I am looking forward to getting the radio, as a kid in jr. high, my
dream was always an HQ-180!
Thanks in advance

Never had a 145 but a close friend bought a new 145X in early 60's,
used it with a Hallicrafters HT-32 & made tons of CW contacts with it.
It was a average cost receiver which was good for most hams!

Receivers can be rated objectively and subjectively. When you compare the HQ-145 with the best receivers available, it turns in ordinary performance. Stability is good for am and below 20 meters. Selectivity is fair. Calibration is fair.

But, despite the fact that I would not rate the HQ-145 as a top end radio in performance, I enjoyed owning and using mine. It has a great feel and is appealing. The HQ-180 is a superior radio, but the HQ-145 was really the end of the line in the development of the 455 kHz receivers, which started with the Comet and HQ-120.

I gave mine away to a foreign ham many years ago who needed a receiver and miss it. Perhaps someday there will be another one in my collection.

73, Colin K7FM

The HQ-145 was the last in the line that started with the HQ-129. It has essentially the same circuit but uses miniature tubes and has a voltage regulator and temperature compensation.

These receivers have a single RF amp stage so the image rejection is not high but they have three IF stages so selectivity is actually pretty good. Also, Hammarlund had a patented crystal filter which was easily the best of the bunch. Collins used the same circuit in their receivers.

This series was intended to be a medium-price adjunct to the Hammarlund catalogue. Their top of the line receiver was the Super-Pro which was also the most expensive receiver on the market during most of its life.

In general Hammarlund have very good quality of construction and good design. The dials are directly driven (no dial cords) and have a very positive feel.

The HQ-145 is interesting in that Hammarlund, who indulged in rather small knobs for decades decided to use extra large ones on this receiver and on the SP-600.

There are instruction manuals on a couple of sites, BAMA for one.

Oh, dear, I need to be more careful. I was writing about
the HQ-140X, not the 145 although some of the stuff applies.

The HQ-145 is dual conversion, which is an upgrade from the HQ-140.
Otherwise, it is pretty much the same.

Scott's right.

I make my living as an airline pilot so I have ample opportunity to witness this "window dressing."

It is all about conditioning. Period.

They have admitted that their plan is: what you see at the airports now will become what you experience as drivers and pedestrians.

```
God help us.

It has all the hallmarks of an aviation/airborne receiver. I'd snoop the GEC
avionics sites.

Good luck.

Smokey

I have one which I just recapped (I got a "positive smoke test with the old filter caps.) It's only double conversion on the higher bands. Its a decent enough receiver for the era, but it is no HQ-180.

It has a decent crystal filter for the era, but nothing like todays filters.

I agree it is in the chain of HQs 120, 129, 140, 150 each of which was a small incremental advance of its predecessor (I'm not really familiar with the HQ-150 and I don't know the differences between it and the physically similar HQ-140. I suspect the rationale for the HQ-145 was to have a receiver in that price niche with the electical characteristics of the HQ-140 (and perhaps the 150) and the styling of the line with the cast aluminum panel introduced in 1957 with the HQ-100 (of which I had one of the very first ones when I was a teenager. It was ordered for Christmas 1956 and advertised about three months earlier. I think I had one of the first 10 of these. The HQs 100, 145, and 180 were general coverage with band spread in the ham bands, and the 110 and 170 were ham band only as they existed at the time. I believe there was also a transmitter and an amplifier with that panel/cabinet design, but I was in college then and didn't see much ham gear.

Aside from the replaced filter caps, my HQ-145 is in very nice electrical and physical shape. I have not used it in actual communications. Someday I'll find a nice Viking Adventurer...one of the transmitters I had as a kid, and pair it up with the HQ.

Hi,
I am getting a Hammarlund HQ-145 receiver that will most likely need
recapping and aligning. I am in Martin County, near Stuart, but not
far from Palm Beach County.
Thanks,
Bob Grimes

G.E.C. became GEC-Marconi. There was an office
in Atlanta, GA near me but they packed off and moved to Dallas, Texas. Look
at GEC-Marconi Avionics which is the name they used here. Looks like WW II.
One place that has lots of experts is the KW-2000 group on Yahoo. They
discuss not only KW-2000's but other gear such as Heathkit UK, Labgear
300's. I am betting there is someone on that group of several hundred that
has something like this receiver.

I have the full set of GE Ham News from the web so I'll look for it. One of the patents is from R.B.Dome and was one of those for the Dome stereo system for FM.

The HQ-150 is a glorified HQ-140. It has a Q multiplier (in addition to the crystal filter) and a 100 kHz calibrator. It is single conversion. My opinion is that the HQ-145 is better than the others for general coverage - except the HQ-180 and the SP-600.

Hammarlund did make a couple of transmitters - the HX-50 and HX-500. They were a different style and probably more suited to the HQ-170 or other receiver that specialized in receiving sideband.

I have Johnson Adventurer and it is a good "no-frills" cw rig and would match up with the 145 nicely.

73, Colin K7FM

I printed this out. The GE treatment is much more informative than the CE handbook and the schematic is drawn in a less confusing way.

This issue of GE Ham News does not have details of the 90degree network, it refers to an earlier edition which has an artical on building a phasing type transmitting SSB generator. That one does not appear to be on-line, at least not on the BAMA site.

Its interesting to me that General Electric was hep to SSB for ham use in about 1950 when it was still quite a novelty. Of course SSB goes back into the 1930's for commercial purposes, maybe even earlier. I don't remember when AT&T began to use it for their transoceanic telephone service.

Any good ham can whip up a good quality 10-20W transmitter in a few hours
from their QST junkbox. Go for it.

i have one now for my hro 60, and need to replace some resistors. i will do the one electro cap at same time. naturally, i don't have the exact cap value (1 mfd, c-10, cathode filter for the 6h6). i have a 10mfd; can i subsitute? i know for power filter caps people often do put in a higher value w/some benefit from it.... bama hro 60 manual accessories section has the schemo.

also -- once i have this thing repaired, about where on the dial could i hear any nbfm? 29-ish mhz? and would a certain EST time or other be better? have coils a-f, but not the e/f scale if anyone has and would part with....

obliged....
ab

While I am not impressed with the site either, there is a term in technical English: "granularity" (think if a grain of sand). It means the smallest division in data or an adjustment. Today's technician or engineer would call it "resolution". In engineering, up until 15 or 20 years ago, the popular term in engineering was granularity - not to be confused with jocularity). Anyway - it is clear in that quoted phrase that the meaning is something like "fine-tuning knob".

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday May 18th 2008
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held on Albany between Mass Ave and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up

time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which offers a 30% discount. By prepaying you get a discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered well illuminated tailgate area is available for all sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776 (M-F 9-5)

********** $1 buyers discount with hard copy of this notice ************

<FF>

Mail the coupon below by the 5th of the April to be a Prepaid Vendor.

FLEA at MIT 2008 Rates

SELLERS

To use your prepaid spaces the named vendor MUST be present.

Maybe for everyone's benefit, everyone (at least the "good" guys here) should realize something that Jack (above) made a comment about. We're all benefitting by these free and open (unmoderated) newsgroups where you have as free speech as free speech can be free. Over the last 10+ years or so, all manner of commercialization has invaded the internet and quite a bit of it has been aimed at getting people to come over to website chatrooms where the censorship, stealing of authored ideas, creation of databases to invade your privacy, throw "in-your-face" advertising, and exploitation of vulnerabilities in your web browsers to place malware, spyware, rootkits, keystroke loggers, etc., onto your boxes (you gus do have your browsers configured to decline cookies, disable java/javascript/pop-ups, auto-anything, right?).

Fine, owners of websites can run them the way they want. Next time these cheap trolls come on here and try to suck/cajole/entrap/entice an audience over to their website chatroom, go and see if you can play the game with them (make a post there and invite people to come back to these really free, open old-fashioned newsgroups and see how long it lasts). As far as I'm concerned, all these guys running censored chatrooms or whatever and constantly coming to newsgroups to suck away "victims" are a bunch of parasites.

Otherwise, we're living in a world where "power" games are being played on us...everything from telemarketing calls to our home telephones to chatroom trolls.

Does anyone know where I could get a replacement slug for a 160 meter coil in the RF board of the TS-530S? If I could get the whole coil, I would be happy also, but I don't want to spend a small fortune on a whole board. The part number of the coil (actually it's a transformer) is L34-2004-05. I can't seem to find any of those slugs anywhere. They are about 1/4 inch wide with a slot for an alignment tool. (Yes, I broke the slug, and now I need a new one :(

Thanks,
Al, WA2AS

Try a search on "Pye connector". I think it's one of those, eg:
http://www.thevalvepage.com/testeq/triplet/1632/1632.htm

All,
I need some help from the community in getting a part number for a Panasonic knob. It is used on the RF1150, RF2200, RF2900,RF2600, etc, etc. It is the small, black, wedge shaped tab that has a yellow colored indent horizontally in front and a veritcal slot in the back that fits onto the knife-type switch. Does anyone have a Panasonic parts listing that shows the part number?

I found some knobs at Parts.com, but there is no corresponding photo. If anyone has a few of these knobs/tabs, I would like to buy them. Any help will be greatly appreciated.

rgds,
Mark S.

The proven way to get the kooks out of any NG is to simply ignore them and they will go away.   For the most part they are lonely souls that do not have a life in the real world.   Off topic stuff in a NG prompts others to listen to their nonsense.   Egnore them for a while and see for yourself

Years ago, I saw some on an early WWII IFF unit. I was told the
connectors were a British type. The mating connector looked all the
world like like a 90 deg, 1/2" pipe fitting. I've never seen one at a
hamfest (including Dayton) or anywhere else for at least 40+ years.

It resembles the connectors for the 2 to 8 mc. "A" set in the Wireless Set No. 19 (see Google) from WW2. k35454.

Hello all & yes, I know it is not truly a boatanchor, but I am "grabbing at straws".
After many years, my KLM Force5 HF Transceiver has made it home.
Unfortunately, the manual didn't return.
Can anyone tell me what year(s) these were manufactured? I have looked for a reprint manual from a lot of the normal sources but haven't found one yet.
Does anyone know of a commercial reprint source that has one for sale, or does anyone have a manual they could copy or sell?
Any information would be greatly appreciated. Thanks. Larry

Hi Al...

I have a junker TS-820....probably the same transformer. I'm leaving for
Dayton in the morning. If you don't find one by the time I get back,
I'll look and see if it's the same.

73, Roger

Tnx to all replies. Seems to be a British connector for sure. Would
replace it with a bulk head SO-239 but don't have much space to manuver...so
will look for an adapter....Not even sure what the thing does...another Ebay
"bargain"
Am off to Dayton Tomorrow AM....will give me another "reason" to wander the
Flea Market ! !

I finally got around to working on a rather sad Drake SW4A. Sometime in its past, the tuning was messed up. The main tuning knob and the skirt are long gone.

I can find several vendors on the web that have suitable knobs, but I haven't been able to find the skirt. I can fabricate a kludge from the photo in the manual, but I am hoping that someone has one.

Everything else seems to be working according to spec.

TIA.

Steve.

```

Norm: 90% sure it is a British PYE connector. Used for example on
those Type 19 Sets, many of which were manufactured in North America
and shipped under Lend-Lease to Britain and Russia. Also on some
airborne equipment as mentioned.
I may have a long unused right-angle female that fits your male
connector, somewhere.
Will go and look for it pronto, cos unlikely will ever have use for it
now.
If cannot find find would it not be possible to fit a 239 that has not
the square four bolt pattern but one that is bulkhead mounted with a
single nut.
Another alternative might be a single hole mounting BNC?
If when I find that connector I'll scan and email pix to you.
Any help? Pls advise.
Terry

Hi Norm,
        I'm sure that you do but, check your email. I've just sent you a
couple of web sources of these.

Well, well thought I could put my hand right on it!!!!!!
But no PYE plug connector.  Sorry.
Looks like someone in UK has a lead on availability however.
Regards. Terry in VO1xxx land.

They aren't available except off a parts radio.  Union Electronic
Distributors lists all those old Panasonic parts, but if you try to order
them, they turn out to be "No Longer Available".

Service & user manuals are here:
http://bama.edebris.com/manuals/kenwood/ts820s/...

ts-820s_service_manual.pdf (16 MB)
ts820s_users_manual.pdf (13 MB)

For parts, you can try the usual classifieds on eham, qrz, etc. Also, there
are:
http://groups.yahoo.com/group/TS-520_820_530_830/
http://mailman.qth.net/mailman/listinfo/kenwood

Nothing that old is likely to have any commonly lost NOS cosmetic parts available. Even the venerable Sony ICF-2010, which ended production only about 5 years ago after being sold for 18 years, has almost nothing of that sort available anymore.

Looking for a central electronics or similar slicer in at least restorable
condition. Might consider an ssb adapter such as the Hammarlund HC-10 if it
has the
conncting cables.

Condition and price is an e-mail directly to me at thompson@mindspring.com

73 Dave K4JRB

Would you consider a solid-state one?  I am looking at doing a design for
one right now, which would work with any receiver with a 455 KC IF.

It seems to me that it should not be too difficult to
design one that is superior to the old vacuum tube models.
There are certainly plenty of receivers out there which
could use an adaptor. Have you any definite ideas about
price range, features, etc?

What I was thinking was to take the AM synchronous detector circuit from OH2GF which was published in the July '93 QST issue. It is based on an NE602 which does not have the best dynamic range in the world but seems to be okay.

I was first going to make up a PC board layout rather than constructing it dead-bug style like the original, then I was going to try one of the new Maxim detector chips in place of the NE602, but retaining the NE804 limiter and phase detector.

If I were going to do it with tubes, I would look into some of the sheet beam tubes that were intended for TV chroma detector circuits... many of them have excellent performance and are very inexpensive (as are all old TV tubes). The 7360 costs a bloody fortune when you can find one, but the 6AR8, 6JM8, and 6ME8 are effectively the same basic design but with less crosstalk.

Sure a solid state one would be OK. There is a solid state SSB adapter on
Ebay for the little solid state receivers ($40 or so). Just need to get one
to match the 455 IF as I am betting the little Chinese RX has an odd ball IF
probably 30 mhz or higher!

Definitely a Pye connector. Standard UK/commonwealth WW2 to 1950s radio/radar connector. (Developed by W.G. Pye (Cambridge) Ltd, which is how it came to be called that.

They are all the same size, but can have diffeent insulation for the centre pin according to the frequency in use. (Perspex/plexiglas for VHF or Tufnol/SRBF for HF are the usual variations, with SRBP/SRBF and polyethylene for the cable-mounted "socket" portion. Chassis connectors (male) are usially nickel-plated brass, cable connectors (female) are usually mazak (diecast metal) though I have seen brass ones occasionally. The cable adapter section is plated brass and comes in a variety of sizes to accomodate anything from Uniradio No.1 through to RG-58 diameters.

There are also barrel couplers (male-male), Tees (all male), a cable-fitting "Tee" (male-female) and a male to PL-259 adapter used with some sort of radar test set and silver plated!

I have some spare cable connectors, so if you're still "stuck" after the weekend, let me know what you'd like and I'll mail one out if I've got a spare.

Best,
Chris.

A slicer by definition has selectible sideband, and maybe specifically
uses phasing to get it.

They existed at a time when there wasn't much but AM radios, so to get
around the "turn down the RF gain, turn up the AF gain and turn on the
BFO" you needed to add a product detector. Once you were doing that,
you might as well add selectable sideband via phasing, since it didn't
add that much to the cost, but did help improve things when the receiver's
IF was wide for AM.

It lives on today, since most "low end" shortwave receivers that have
synchronous detector uses the phasing method to increse performance
without the cost of an actual better IF filter.

There were external SSB adaptors that included an IF filter for SSB,
but I can't think of seeing any that called themselves "slicers".

Shelby Hamfest is ON! It will be held at a VERY nice park just east of Shelby in a small town called Dallas, NC. Gastonia, NC is nearby. The new venue for the Shelby event is Biggerstaff Park. It is 100 acres in size with ample parking, buildings, and wide open spaces for tailgating. It is a BEAUTIFUL park that surpasses the Shelby Fairgrounds in every way! There is much SHADE where tailgaters who arrive early to select a spot can find a place under a shade tree!!! Dealers will find several sheltered horse stalls to set up.

There are 2 lakes onsite. There are softball fields, tennis courts and plenty of nearby restaurants as well as motels. Campsites, too!!

Directions are simple. Take Interstate 85 to Gastonia, NC (west of Charlotte), Exit 17 (I think this is right), Gaston College exit (well marked), Highway 321 N. towards Lincolnton, NC. See Dallas/Cherryville Highway exit. Go UNDER the underpass, circle around to the right (you can't go any other way) to stoplight. Take left lane going towards Cherryville, NC. The park is on the LEFT about 1/4 mile away. You'll see McDonalds, KFC, Arby's and a new Bojangles. There will be PLENTY of signs and markings--almost impossible to miss. And, of course, talk-in!

Folks, if you come to the 2008 Shelby Hamfest, you are in for a treat! The park is excellent, there are plenty of amenities, and IMHO, the Shelby Club has pulled off a real COUP, showing that bunch of goofs at the fairgrounds that they are NOT to be messed with!!! :)

I think the Fairgrounds people thought they could jerk the Club around any way they wanted to because there was not another place in the area that could hold it. They didn't count on Gastonia having a large number of parks and recreation facilities, and the Parks & Recreation folks over there were just WAITING for something like this to happen! Like panthers, they POUNCED and secured this event. HIIIISSSSSSSS! :) HA!

73

Jerry
(not a Club member, but anxious to be there on Labor Day weekend!!!)

Tony, The BC-191 and BC-375 are very collectible. If all the units are in excellent condition and if the tubes are present (and also good), it would be worth over $600 in the US. Arguably, only 3 of the tunings units would be actually usable but all collectible. The biggest issue would be shipping from your location to the US, assuming you're located in Europe.

Regards de K3HVG

Just to let all of you know on this forum http://www.thetubecenter.com has totally revamped its website to make it easier for you to get your hands on the tubes you need. We have over 3.5 million tubes and related products on our shelves so please check out the site and I am sure you will find all of the tubes you need for your next project, or to replace your burnt out tubes.

Thank You,
The Tube Center Webmaster
Chris Sibbert

Hello All,

Just after divesting myself of nearly every radio I had, I find myself 'pulled back in'. I have a fellow engineer that works in our Germany office, who showed us a very good time when we were over there. He is also a collector of radios, and even toured us around the amazing historical communications collection at the 'communications technology institute' he had attended (forgot the name).

He is 'retiring' of sorts; he will be going back to school for his PHD and working part time in the company labs. For his 'retirement', a couple of us here would like to give him a nice old radio. One of us found a good Hallicrafters S-19R Sky Buddy.

I am asking for any photos you might have of the Sky Buddy, inside and out, closeup, to help get my bearings. Post to the board, it might help others in the future - but make 'em as high res. as possible. I could really use a shot of the pointer and the speaker.

Thanks,

David Goncalves

Thanks Jeep for the vakuable information.

I am not intentioned to sell it, but I was just wondering whether it is worth what I paid it.

A Google search found several sites. Try:
http://www.w9wze.net/Restorations/S19/S19_KB9TMY.htm
This has pictures of the interior and of the tuning mechanism alone.

There is a good photo of the overall receiver at:
http://www.antiqueradios.com/gallery/v/Hallicrafters/s19r_batting.jpg.html

More photos showing two versions at:
http://oak.cats.ohiou.edu/~postr/bapix/S19.html

Another at:
http://www.rigpix.com/hallicrafter/s19r.htm

I'm sure there are many others.

There is a manual at BAMA

Whenever I ship old WW II surplus gear, I feel guilty packing it well (but I do, anyway). It is rather odd that they were designed to survive flak, bullets, rough landings and severe turbulence, yet we worry about them not surviving a trip in the UPS or USPS truck with good shock absorbers over paved roads.

I wonder when the last BC-191 was pulled from service? I had a friend who told me they were still using them in the 60's.

In good condition, they are worth whatever you paid for it.

73, Colin K7FM

Does anyone have, or know of, a business that will repaint and re-screen faceplates for Heathkit SB Series amateur radio equipment? I have an SB-401 with a faceplate that--no pun intended--could use a facelift.

Concerning Heathkit paint, I know the signature green color actually varied over production runs; however, was it always applied as a wrinkle finish? I=92ve seen pictures of SB Series equipment that, to me, appear to have a matt finish.

Lastly, although the gray paint on the cabinet of my SB-401 is in generally good shape, it could also use some sprucing up. I=92m wondering if a light overspray on the existing finish would work. Has anyone tried this?

A subject that has been getting under my skin recently.

The proper name for specific tubes

It seems that people, even the manufacturers can not figure out exactly what type of tube they own, are selling, or even producing. You have various people call the exact same tube all of the above (Beam power tetrode, beam power pentode, or pentode). You have manufacturer data sheets calling it something that on actual inspection, it is not.

For example. The tubes..

6AG5

6AH6

6BC6

6CB6

6GM6

6BZ6

...(on and on)..

Second section of..

6AM8

6GH8

6U8

...(on and on)..

All of them have an electrode structure that upon close inspection that looks like/is a beam power tetrode. But the sales pages, and even the datasheets call it a pentode. The datasheets show it with a suppressor grid, where it actually has beam forming plates. What gives?.

You have a few people that have determined what they actually are by direct visual inspection, and actually call them what they are, but that is few and far between.

Is it just that the curves are close to a pentode, so the manufacturers are trying to avoid confusion to the average end user?

And as far as people calling them beam power pentode, unless they actually have three grids, and beam forming plates, then I don't consider it to be a beam power pentode.

Is it just a big international conspiracy to confuse me?

Prior to, I think, 1967 or so the non-wrinkle finish seems to be what
they used, and post-1968 or so it seems to be a wrinkle.

My data point is that HG-10B's always have a wrinkle finish, and
HG-10's don't.  Same for DX-60B's vs DX-10's. Some have even told me
that the ONLY difference between the HG-10B and non-B version is the
paint job!

Tim.

Hi
   Is it possible to hookup a Radiola III to a triple power supply. The
Radiola schematic shows all the batteries interconnected also the
schematic voltages and the battery voltages don't seem to jibe.

Many thanks
Ian

RCA did the right thing: they always called their tubes "beam power
tubes", completely sidestepping the tetrode vs pentode terminology.
```

I think RCA was careful to not call them "beam power pentodes" because
some European company held European patents on power pentodes with
similar beam-forming plates. I think RCA was trying really really hard
to not have them identified as pentodes. Licensing and intellectual
property rights to tubes' innards was something that companies were
really protective of - look at the wording on the flap of any tube box
up through the 70's to see some legaleze.

Although my gut feeling is that they are actually pentodes (maybe if
you don't run the beam/supressor grid out to a pin it doesn't count as
an electrode?) because those beam forming plates gotta be a tube
element.

The ARRL (almost) always drew beam power tubes like 6146's and 807's
as tetrodes and classified them as tetrodes in their tube charts. You
will note that 6146's and 807's don't run the beam/suppressor grid out
to its own pin but make it share the cathode pin.

Tim.

AES sells a little power supply just for battery sets
that will power your Radiola 3 just fine.

Colin,
Good question. It appears the BC-191 was stricken from the logistics
support list in/about 1955. In the early 50's RTCA Proceedings, the
likes of the ART-13 and other non-crystal-controlled equipment were

being called into question and removed from aeronautical service (frequency stability and spectrum) and that prompted, for example, the Comco crystal control module that one often sees in ART-13s. The USAF and Navy did have some ART-13's still used in acft up into the 60's. In about 1959, as a CAP Cadet, I fired up an ART-13 and BC-348 on a C-47 on a famiz flight from ADW to Wright-Pat. My current Navy ATC-1 was surplussed out of Moffet in 1976! The frequency card has a date of 1963. That's probably why it worked when I got it. Even that seems awfully late, given that SSB was the thing to have at the time. I suspect that a lot of the older gear was still in operational (esp. C-47/R4D) vintage acft but not really used. Finally, in TM 11-487A (also T.O. 16-1A-3), Directory of Radio Communications Equipment, dated August 1950, the BC-191 and the associated SCR-series using them are still listed. The BC-375 and associated SCR-series are deleted, however. In the 1955 issuance, they are both deleted. Maybe that sheds some light?

There are BOTH beam power pentodes and tetrodes.

RCA used to show the beam power tube with the symbol for the beam
deflection plates, but later they got lazy and just drew a third grid.
If you actually broke the tube open you WOULD see a 'cage' instead of a
third grid.

Most beam power tubes used as AF power amps were "Pentodes", assuming
you count the beam deflection 'cage' as one of the elements. Such tubes
would have 5 elements making them Pentodes. It wouldn't matter if this
cage was connected to the cathode or to it's own pin, it's still a

pentode.

Other special beam power tubes actually did NOT have a 5th element. They had the turns of the first two grids aligned, and the spacing between the grids and the screen grid and the plate were set to minimize secondary emission. In addition, the plates had curved pockets in them designed to enhance the capture of electrons to prevent any secondary emission from ever reaching the screen grid. Tubes such as the 4-400 and 4cx250 were examples of such beam power tetrodes.

Hi Charlie;
Did you know that KC9YS is making new ones?
I seen it on the Drakelist.
His E-mail is kc9ys@sbcglobal.net

Yeah, I was surprised when I first noticed this. Little TV IF tubes
with beam forming plates! And always drawn as a pentode and called a
pentode. Maybe somebody will make a headphone amp with 6CB6s and call
them beam power tubes. :)

Well to me, a pentode is just a tube with 5 elements. Cathode, plate
and three something-elses. Historically those were three grids, but I
don't know why the 3rd element has to be a grid.
>
> And as far as people calling them beam power pentode, unless they actually=

I think the descriptor "beam power" is similar to "sharp cutoff" or
"remote cutoff". A remote cutoff pentode isn't a pentode with an
extra element, but a pentode about which the description gives
additional information. Same with beam power pentode. But "beam
power tetrode" is much more common. So just listen up to the "beam"
word and then ignore the rest.
>
> Is it just a big international conspiracy to confuse me?

Hadn't thought about that before, but I think you're probably
right. :)

English is not your native language because you have misspelled almost
everything and failed to punctuate anything. Given this very short exchange,
I have trouble believing your claim that you don't write badly.

Sorry ...

In other words, this guy's project is to: i) disrupt the newsgroups, ii)
attract people to his personal blog, iii) censor in any way he feels fit
to censor, and iv) maybe collect into his own personal "spy" database a
collection of information, data, dossier, whatever, on anyone who responds
to him.

There is a lot of this trash on the internet these days.

Yeah, I noticed the spelling, grammar, sentence structure, and thought
structure in his -- what is it? -- big long sentence (was that a
sentence)?

A parallel bastardisation of "marinate" (a cooking term) but emphasizing
the root word "moron".

You have to become an amateur psychiatrist to figure out how these guys'
(scatter/scattered) brains work, and in the end maybe you don't have much
choice but to give up.

Yeah, I'd say he's a troll. Not even a good one, either.

A good troll would stimulate discussion, stimulate the brain, cause
focused, purposeful, useful discussion and otherwise be good for
something.

Just what the crap does it mean in his tip for tuning SSB where he
says he had to "go to finer graining turn"? Anyone want to take a stab
at translating that? The only thing this guy uses his head for is to
hold his ears apart.

Unfortunately (and I did look) it's not that helpful.

The "Second to fourth echelon work" EMER (File 169) does not contain the circuit diagram.

"Notes for Radio Mechanics Part 3" (File SIG123) contains a circuit and some notes, but no component values.

The "General Description" (File 170) contains the circuit diagram but is in absolutely terrible condition and needs to be rescanned if we've still got it. At least the component list appears readable. I think it's a badly faded mimeograph copy that didn't scan well.

It needs looking at (and some more work), I'm afraid.

Chris.

MUSLIM'S SAY MECCA SHOULD BE THE SOURCE OF THE WORLD'S TIME
Clearly the goal of Islam is to have a global Caliphate = muslims will conquer and rule the world. I and many others have chronicled the overt and stealth invasion of the UK, Europe and elsewhere by muslims and the atrocities committed in the name of Islam. A relatively new muslim movement is to create an internationally enforceable "legal instrument" by which muslims can stifle any type of free speech, in the Western world, against Islam. Currently muslims are being encouraged to file lawsuits against anyone they deem to be offensive to Islam -- often using ludicrous "Human Rights Commissions" to do the dirty work as in the famous Ezra Levant case.

Now muslim "scholars" have decided there is yet another way to implement their Global Caliphate. Insisting that "Mecca is the center of the world's land" they want to change the reference point for world time from Greenwich, England (Greenwich Mean Time) to............where else but Mecca. They have even invented the Mecca watch. Muslims balk at what they feel is the Western world inflicting Greenwich upon them. In fact these inbred thinking "scholars" even want to discard Western maps.

For those who continue to keep their heads in the sand and refuse to believe in muslim's desire for world domination - it is past time (Greenwich Mean Time) for such dhimwits to wake up.

Tony

I have one on my website at http://www.vk2bv.org/radio/ws38.htm which
doesn't require passwords and so on to access. Info on a number of other
bits of interesting gear too. The Mk III appears to be the same but with
a different case and an external calibrator.

Simon

Foolish. Everyone knows the prime meridian belongs in Paris, precisely
where God and Francois Arago put it.

I picked up one of these "over there" and it works, but when I transmit
on SSB the needle wavers back and forth quite a bit. Now, my AC Line
is not moving, so I wonder if it's picking up RF ??

Anyone have the schematic for this meter ?

Thanks, Dick, W1KSZ

Hi Joe,
I had contacted them this afternoon. They no longer repair movements.

Thanks,

Dale

Hi,  I have had one of these RCA expanded-scale AC voltmeters
for more than 20 years, and the jiggling meter effect
is the same on mine.  I assume the very underdamped meter
starts swinging every time a neighbor's refrigerator
compressor kicks on or off.

73,
Ed Knobloch

Hi Norm

I suspect the "decals" are more likely to be screen printed with paint
rather than hobbyist water transfers unless they are on the back of a
glass dial. If so, you can probably use the standard method of surface
cleaning electical equipment, methylated spirits. You might like to
check a small spot of paint first.

Simon

Ive always had good luck removing smoke film with 409.
Spray on, let sit for several seconds, then wipe away or blot with paper
towel. It wont eat paint or silk screening.

As with any restoration, try a test patch somewhere first, like on the
back or side near the bottom.

I think it would be safer to try a solution of dishwashing detergent in warm water first. This is surprizingly effective and safe for most materials. Next up would be a household cleaner like Formula 409. Any solvent should be tested using a cotton swab on a spot that isn't too visible. Rubbing alcohol may also work and is safe for most paints and materials (but not cellulose nitrate or acetate both often used for old dials and dial windows).

I'll second the motion of others with the use of 409 or Fantastic.
Where I do NOT use these cleaners is on the inner frequency calibration

dials of most equipment. For these, I use warm water and perhaps a bit of diluted dish detergent. Another step I use is to wax the front panel with Turtle Wax to get a uniform finish. Do this before reinstalling all the knobs. For wrinkle cabinets, etc., Armour All does quite well.

Depends what the decals are.

Ammonia will remove a lot of tobacco smoke, and it's very easy on most panel
surfaces.

Formula 409 is a lot more effective. It will be fine on silkscreened paint
although it can take some lettering off so try it on a small corner first.
I have used it to turn broadcast equipment from bright orange to white. It
is very powerful stuff and you should be careful with it. It will etch
bakelite, by the way.

Another solution is to take up smoking, especially cigars. Then soon all
your equipment will match.

FOR SALE - One Unique Tempo One

I have a Tempo One, formerly owned by Penn Clower (W1BG). It is a very nice unit, with unique and very useful mods, ALL expertly done.

1. SuperFuse - After a burnout of the transformer, Penn decided to design a circuit that would prevent any failure in the transceiver from burning out the transformer again. He individually fused the 600V, 300V, 150V and -100V lines, and added neon lamps in parallel with the fuses. If a fuse blows, the lamp turns on, triggering a photodiode to cut the AC, then pulsing at a very slow rate, cutting all voltages in about half. The SuperFuse is described the October 1982 CQ magazine (copy included with radio).

2. In SSB mode, there is a 2.7 Khz audio lowpass filter to cut down on hiss. In the CW mode, there is a 1Khz lowpass filter. In addition, there is a 800 Hz bandpass filter, turned on by pulling the ANL knob. (ANL functions as normal for SSB and AM).

3. Selectable AVC.

4. The CW level control is moved from the rear to a concentric control in the Mic. Gain position (dual pot). He used a matching concentric control knob.

5. The VFO has been adjusted for a maximum error of 500 Hz across a band.

6. The 6U8 in the RF amp section was changed to a 6EK8 to take advantage of higher gain up to 10 meters.

7. The 6BM8 audio amp tube has a heatsink/clamp to both help keep the hot tube cooler, and reduce microphonics.

8. All mods have been documented (schematics and notes) with the manual. Addditional memo from W1BG, and copy of CQ article included.

9. A spare Tempo One and PS is inclulded.

I used the transciever a couple of times, and it worked for me.

I am looking for $250 for the whole set - The UNIQUE Tempo One and Matching PS (With SuperFuse) and PS cable, and a SPARE Tempo One and PS (w/ PS cable) for parts.

--

Does anyone know what Formula 409 consists of as it is not in my
supermarket or chemistry book? Is it just a local product in one country
or maybe it is just acetone, alcohol or methylated spirits under a fancy
name?

Thanks for any help.

Simon

One thing, from the ingredient list I posted earlier is Formula 409
contains Butyl Cellosolve. This is terrible stuff on plastics. It is
what turns clear plastic molded meter windows foggy. I would not use
Formula 409, or any other cleaner that contains Butyl Cellosolve on
plastics of any sort. The stuff soaks into the plastic and makes it
sticky and soft... sort of a plasticizer.

It's 2-butoxyethanol, with a little soap and water and a pH buffer to keep it
alkaline. In the US, you can buy commercial degreasers with much higher
2-butoxyethanol content (Ace Hardware sells something by the gallon that is
almost half 2-butoxyethanol), but 409 is plenty strong.

It's a good solvent for anything greasy or oily.

It's fine on most plastics.  It's a disaster on others, most notably
phenolics.  It will etch the hell out of bakelite and leave you an ugly
dull surface.  Test before using.

Ford cars all come with warnings not to use cleaners containing butyl cellosolve on, or around the instrument panel. They tell of the damage they will cause to the speedometer window... And I have ignored the warning with 409, and other glass cleaners, and fogged the dash windows.

I used to use 409 as a general cleaning agent on surplus test equipment, until I started to notice that I was ending up with power cords that became sticky, plastic tote handles that became sticky, and wrinkle paint that became softened and sticky. All anecdotal evidence, I know, but much of this equipment survived 20 years before my cleaning them with 409 without these failures occurring.

Butyl cellosolve is used because it is an incredible penetrating agent. It burrows deeply into grease and grime, and softens it so that normal detergents can wash it away. It also does this to many plastics and rubbers. I believe that clear plastics that are polystyrene based are particularly affected by 409.

If you do use 409, always rinse it away with water, never just spray and wipe, as the manufacturer recommends.

Isopropyl alcohol is a great solvent for cleaning, but it too can cause problems with some plastics. Never leave acrylics soaking in isopropyl, as it will cause them to form deep cracks without ever softening the plastic.

Anyone have some ideas on restoring some old black knobs to the original glossy finish? These are the black knobs possibly made from bakelite? used on the HQ-170 receiver and many other old boatanchor type equipment. I have a couple of the knobs on my old AT-1 that have gone dull and I would like to return them to the nice glossy finish? Thought about cleaning them real well and then spraying them with some type of clear glossy finish? Possibly there is a better idea out there. Thanks & 73, Randy, w5kcm

Hi Randy,
I have used repeated applications of motor oil on my Collins bakelite knobs.

Hi Randy,
  I have used Amorall successfully to bring back the luster on both
knobs and black wrinkle finishes. KF6KXG Mike

I've always understood that using black shoe polish (KiWi brand) is what
is used for reconditioning bakelite knobs.  I've never actually tried it
myself but have read this several times in the past...
Give it a try.

I use a buffing wheel and jewelers rouge. After buffing, you may use
automotive wax for a nice shine.

Are these mica trimmers or big air variable caps?

The problem is that the surface gets etched, and you need the surface to
be smoothed out.  Green jeweler's rouge on a rag and a little elbow grease
will do wonders.

I tried toothpaste... it is too fine.  Just takes forever.  Might be okay
to use toothpaste with a buffing wheel but definitely not by hand.

Scott and others

Thanks for the info - sounds fine for greasy metalwork but not plastics, paint or rubber.

Simon

The "official" stuff here on Airstrip One, is called "Paste, Polishing, No.5" and originally used by the GPO for cleaning Bakelite telephones. It's also sold commercially as "Bake-O-Brite" ore somesuch, and can usually be found on eBay.

Basically it's a wax polish with a mild abrasive added.

Chris.

OK, I have the EMERs, and it looks like the complete set with all 10 modifications, the miscellaneous instructions, etc.

Scanning in progress, though this may take a while.

Do you have a high-speed connection, or would it be easier to run it all through a photocopier and mail you the result? (If you want the paper copy option, I'll need your postal address.)

Best,
Chris.

   I wonder if automobile rubbing compound would work. This
is used for restoring badly oxidized finishes or for
painting where several coats of laquer are to be used.
   Its sold under many brand names and can be found in any
auto parts house and most hardware stores.

Again liquid diswashing detergent works well and is
pretty harmless. It should remove tobacco residue but may
need some time or several treatments.

Thank you very much Chris,

Yes, I have a high-speed connection at home, but for bulky files it is better to use my business mail account which has a virtually unlimited storage capacity.

Address is antonio.vernucci@space.it

73

Contact Mr. Kaplan at www.odometergears.com and ask if he can make you
a replacement.  I have been very happy with his replacement gears which
seem more rugged than the original delrin, and he is willing to make the
occasional custom molded one.

Hi Joe,
The 1st responder also gave me this link. When I called, they did not seem to know too much about movement repair- although they do repair instruments.
Their response was that I should buy a new meter; which is not possible in this instance.
Do you have any recent experience with them?

Dale

I have a very nice Heathkit HW-100 for sale.  Not too many of these
left.  This is a collectors item.  It does work but remember it is a
tube radio that is nearly 50 years old.  "There is nothing like making
a contact on an antique. $200 obo    73 Gary  reply to k0imj@juno.com

Hi Dale,

I am an amateur watchmaker, and I have been known to repair meters
from time to time.

What seems to be the problem with yours?

Hairsprings can be straightened, iron filings removed, armatures
rewound.... I can't replace jewels cracked jewels, because I don't

have a source for new jewels.

-Chuck

Hi Chuck,
There is a spiral "spring" on the rear of the armature that connects the
armature winding to the (-) external stud on the meter housing. The "spring"
broke at the armature end. Obviously, soldering it would create too much
weight and about 1/2 to 3/4 turn is broken off. Ive thought about charging
up a cap and spot welding it, but afraid I might either ruin the movement or
vaporize the spring
This is a 1mA movement and although I am not all that familiar with meter
types- guess this might be called a moving coil type?
It goes on my Hallicrafters Cyclone. Oddball size- 1.97 X 1.97".

Fantastic,
The meter is on its way as of this morning. It's from  my Hallicrafters
Cyclone- a very hard size to find.

Dale W4OP

Please don't use motor oil, WD-40, Armorall, wax, etc. Those are temporary coatings which must be reapplied and actually attract dirt over time.

Use Novus Plastic Polish #2 and a soft toothbrush, followed by brisk rubbing with a soft rag. The shine will last forever.

Available from many online suppliers, such as Antique Electronic Supply, http://www.tubesandmore.com/ .

I have used #2 to polish hundreds of radio dials, knobs, bezels, etc.

Don't use #3 -- too abrasive for most situations. I also don't have much use for #1, which is more of a protectant for something that's already shiny (and could be cleaned up just as well with mild soapy water or Windex).

If you clean and polish the knobs correctly, there is no reason to spray them with any sort of new coating. The knobs were not sprayed with stuff when the radio left the factory.

I'm currently using McGuire's Mirror Glaze 9, "professional swirl
remover 2.0". It does the job and provides a permanent finish and is
easy to find.

In article <WTtQj.2975$1M1.415@newsfe23.lga>, George <k5wwo@cox.net> wrote:
>Air Variables

Okay, as I recall there was an ECO on the big air variable on the SB220,
because there were some arcing problems with it, so it was replaced with
a heavier-duty one which caused the arcing to occur at the bandswitch
instead.  So if you can find pulls from another SB220, make sure they are
the same ones.

Big air-variables are not easy to find in new production any longer, sadly.
The 250 pF you might be able to find at Fair Radio if you can deal with
some slight mechanical changes, though.

What happened to the originals?  Arcing or are they bent-up?  If they are
bent, it may be easier to disassemble and straighten the plates than to
replace them these days.

I use a buffing wheel, but run it with a variac at lower RPM's so as
not to burn the knobs/plastics, etc. I just use the white buffing
stick for rouge and it really brings stuff upto a really nice shine.
Of course I have two buffing wheels, one for plastics and the other
for metals, never use the metal one on plastics!

I need a new Dial Drum Spring, part number 258-10 for my Heathkit
Mohawk. This is the torsion spring that pulls the dial back around as
you change bands. Does anyone know where I can find one?

Thanks

James L. Wiley

James, watch eBay. I've seen them parted out from time to time.
If you see someone selling the bigger items, you might email
them and ask if they have the spring as well. Have you tried
the better hardware stores in your area for a workaround?
Many of them have good odd assortments of hardware
that you wouldn't expect to find.

Pete

Thanks for all the great ideas. I am going to order the Novus Plastic
Polish #2 from Antique Electronic Supply. That seems to do a great job
for a lot of different plastic items. I will give that a try on the
bakelite knobs.

     I don't think you are mis-representing this but
potential buyers should be aware that this is NOT a standard
HRO. It has a 175Khz (standard is 465Khz) IF and no crystal
filter. I suspect the image rejection may not be very good
on the HF bands.
     I wonder what the Navy used these guys for.

I believe the 175 kHz if was used because the radios were used below 500 kHz. With two rf stages it should have good image rejection up to 14 MHz.

Beautiful receiver Colin K7FM

LF IF's were common in automobile receivers because they
had higher Q and better selectivity than those at 455 or 465
Khz, I did not see if the this RC is intended to receive the
marine band around 500Khz, if so the lower (or higher) than
standard IF would be necessary. The coils will not be the
same as for
standard RX because of the different IF frequency
The assembly in the photos looks brand new!

   I managed to find something on the RAS. It is a modified
HRO Jr. with the lower IF to allow its use at 500Khz.

```

I have a Heathkit SB-101 with matching speaker/power supply and one or two other associated odds and ends that I'd like to get into the hands of someone interested in restoring it. It actually seems to be in decent shape. The major exception is that something is mechanically limiting the VFO to about 200kHz rotation. Includes manual. I would prefer to find a new or needy ham with enough technical background that a bit of work on electronics isn't daunting. For such a person in the Seattle area, the price will most certainly be right: come get it. If I have to ship it, you'll pay shipping and something to compensate me for packing it up.

The low IF is so that they could be used in the 250-500 KC marine band.

The bad news is that the IF is JUST in the wrong place to use them on
160-180KC.

Long term monitoring - as they were pretty stable. And since they were capable of monitoring the international distress frequency (due to the modded IF) - they saw a good bit of use doing that.

Hi to all,

I am looking for a relay for an old Dentron GLA-1000. A fellow brought it to me for repair, and I found the relay physically broken. The manual calls it a 3PDT, but in looking at it seems to be DPDT. There are only two contacts side by side. 12 volt coil and I have no idea what the resistance might be. Any help greatly appreciated.

Thanks
Mike/K5VSE

I am building an antenna tuner--a clone of the XMATCH and have a spiffy metal cabinet. The front panel is aluminum and the rear panel is steel. I would like to finish both panels in a creamy white color--the rest of the case is in a black crackle finish. What sort of paint/primer is recommended?

Thanks,
Mark--K8LD--

Tom, I have a couple of those VFO's. I'd wager a buck to a doughnut that the
problem is the geneva wheel. There's a 5 turn one on the front of the shaft
and Heath lubricated it with something that turned to gum which welds
several of the wheels together. A drop of WD-40 or acetone or the like frees
it up so it acts like a Geneva wheel again. Clean it off and lube with some
good Moly and it'll never happen again.

Thanks, Harold.  That did the trick (some rather indiscriminantly
applied WD40), though I didn't see any easy way to get it far enough
apart to lube things.  From the shaft position relative to the tuning
capacitor, I gather there's a worm drive in the VFO box, along with
whatever stop mechanism they used.  I would have thought they'd just
use a stack of little washers with tabs on them, and not full-blown
Geneva wheels.  I'm not too keen to spend the time to tear it down far
enough to get into the VFO box to properly re-lube things.  I'll see
if I can get it into the hands of a new and/or needy ham--still would
like to find someone local (have one reasonable taker but that one
would involve shipping, which I'd prefer to avoid.)

Cheers,
Tom

Zinc Chromate or aircraft primary for the aluminum.
Any good metal primary for steel panel.

My recollection is it is just a stack of tabbed washers, and the grease
glues several of the washers together, thus limiting the number of turns
by an integral amount.

The difference between a Geneva wheel and this tabbed washer scheme is lost on all but the watchmakers.

-Chuck

Note: A Geneva wheel is a Maltese cross like disk that interacts with a wheel (gear) that has a single tooth. With each revolution, the single toothed driving wheel engages the Geneva wheel to rotate one "cross arm". When you get to the final revolution, the single tooth is blocked by a section of the cross that hasn't been cut away.

The Geneva wheel was originally used in watches to limit the number of turns the mainspring could be wound.

Mark Paley wrote:

> I am building an antenna tuner--a clone of the XMATCH and have a spiffy metal cabinet. The front panel is aluminum and the rear panel is steel. I would like to finish both panels in a creamy white color--the rest of the case is in a black crackle finish. What sort of paint/primer is recommended?

Krylon is pretty hard to beat for most small jobs, and you can probably find the color you want (I usually use almond for small panels - but that may be a bit dark for your taste for this project). If the metal is well prepped, you don't need a primer; if not - then they have several primers that work well.

For the black wrinkle - my experience is that priming the metal (steel nor aluminum) does not provide as good a finish as I like. There is a "tutorial" I wrote many years ago about "How to" do black wrinkle and get as good of results as the better military finishes. You can find it on-line at several of the Antique radio club sites - including the "defunct" but still accessible Mississippi club site:

http://www.comcents.com/mhrs/wrinkle.html

good luck on your project!

best regards...

It depends entirely on the application and how the tube fails in that
application. But yes, Varian has done statistical analysis and there is
an Eimac white paper on filament voltages.

>Regarding higher filament voltages, I remember as a kid that we had a TV

>picture brightness did come back to fully normal levels.

Yes, the picture tube brightners will get a little extra life out of a
CRT with poor emission. So will a "CRT Rejuvenator" which will throw
a large reverse voltage on there to blow debris off the cathode.

>Surely there are a few people out there who have done some actual
>(experimental) playing around with their tubes and can tell some stories
>instead of passing on technical rumors.

I suggest getting the Eimac white paper. Or for small signal tubes, a
copy of "Subminiature Electron Tube Life Factors," an NTIA report authored
by some Raytheon folks.

I will trade my 10 month old IC-7000 with LDG AT-7000 antenna tuner for your Collins KWM-2A with power supply.

Are you looking to modernize? I want to set up a vintage station.

My Icom IC-7000 has had the AB5N microphone modification done - no other modifications. It is in superb condition and works 100%. Never around smoke and never mobile. Included is the original manual, original microphone, power cord and amplifier interface cable that allows interface to older amps without damage to the radio. I also have the separation kit for it. The LDG AT-7000 is in as new condition and operates perfectly. For the right deal I would also include a brand new TigerTronics SignaLink USB interface that makes digital modes a snap to run - this is the one that folks are having to wait 2 months for. Also I would include an MFJ 4225

Switching power supply in as new condition.

Please let me know if you have any interest.

I am not interested in selling this equipment and I am not interested in getting rid of parts and pieces. The deal is all of it for a good solid KWM-2A in 100% operational condition with a power supply.

If you need references, my eBay ID is cal01.

Thanks!

Cal Barton

Nice stories below. Credible. Thanks. I have a few comments below.

On Sun, 6 Apr 2008, COLIN LAMB wrote:

> My Collins KWM-2 uses a home brew power supply. Step start on filaments - at correct voltage and no high voltage for 60 seconds. Same tubes in it for 30 years. I think the only two power amplifier tubes that failed were dropped on the floor. Some amplifiers adjusted the filament voltage to be correct and some were never measured.

Out of many dozens of tubes in ham gear, I think I never lost one by any failure mode. I found an old Halicrafters S-85 at a hamfest and bought it out of nostalgia. Has original tubes (all marked Halicrafters).

Our B&W TV sets (when I was a kid), however, had maybe half a dozen tubes go soft and needed replacing. I've bought a number of ac-dc AM/FM radios with tubes at hamfests and still have original tubes and still work! Vintage 1950s.

> I ran a 3 x 813 amp for years and never changed the tubes or even measured the filament voltage. Just used a transformer with the rated voltage and called it good. Unless the filament transformer has a current rating much higher than the demands of the amplifier tubes, the surge will probably be ok.
>
> Incidently, the home brew equipment looks practical. I built a vfo using the Collins 70H3. The problem with it is that it covers 1.5 to 3 MHz with 10 turns. That is 150 kHz per turn. Bad for a linear dial.

Yeah, I know. So, I use gears and don't worry about more than couple kc accuracy. I'm not a Digital readout freak.

I bought a couple of R-390 VFOs from Fair Radio Sales (Lima, Ohio). Out of three I bought, two worked and they are something like 2.4 to 3.4 mHz, and so 100 kc/turn (ten turns nominal, twelve turns real, and still linear, they go actually up to 3.6 so can use directly on CW part of 80 meters).

   I used a 8:1
> reduction gear and a crystal controlled mixer to cover 5 to 6.5 MHz, then limited use to 5 - 5.5 MHz. That was coupled in as the second vfo for my Drake TR-5, so when I switch it in, the Drake digital dial displays the frequency. Extremely stable. Oh, I converted it to solid state, also, which is easy to do. There is one minor problem in that there are no stops on the dial. Not a problem for me, but if some kid came in and started twisting, he could break something. Oh well, you need to take some risks in life.

make your own stops.

> tube filament failures?

Yes. The advice of tube manufacturers comes from experience with fairly
large populations of tubes and what is wrong with us all just actualy
talking about our own actual experience (like I did)?

> It is unlikely that any of us have run herd on as large a sample set of tubes as the manufacturers did.

But a lot of us old timer-types surely had--just like me--several amplifiers running 2-3-4 tubes in parallele, and for years, and that starts to add up to a population of 10-20 tubes (at least for me). Not large, but enough.

Clearly the chance of filament failure
> among transmitting tubes (or any tube for that matter) is pretty small.

As I've said before, "chance" is speculative. Out of all of my hamming and SWLing, I have heard very little on guys turning on their amplifiers and discovering a tube that didnt' light up. I've heard more stories of guys smoking their little metal-ceramic forced-air cooled tubes from overdriving their grids, or "pushing" tubes, or using sweep tubes (I've had a couple from hamfests where there was hardly any emission left) that were maybe not tuned up fast enough, or whatever.

> If we switch our focus to incandescent lamps, an example of a tungsten filament with which we all have large experience, we could perhaps extrapolate that anecdotal experience to tubes in general.
>
> If I eliminate the cases where I dropped, or thumped the lamp bulb (trouble lamps), I cannot remember a case where a household tungsten filament lamp has failed at other than turn on or turn off....

Agreed. I've had a few flicker a bit and then a few light turn-ons later...poof and it goes out.

and since I have spend my
> life living with others, I cannot say for certain that those cases where I thought the bulb must have failed on turn off, weren't actually cases where it failed at turn on for a house mate, and they didn't take the time to replace the bulb, or feel the need to tell me about the failure.
>
> If, however, we wish to ditch the anecdotal evidence, there is ample statistical evidence, compiled by the lamp manufactures, to allow them to come up with the following equation for tungsten filament lamp life:

> Which means by simply lowering the lamp's applied voltage by 5% we increase its life by nearly 2 times!

Yes, and sometimes it is worth doing this. I'll bet that the long life
bulbs out there are made with a little more filament wire so the
temperature is maybe (also) 5% lower, too.

> Which fits very nicely with the wartime conservation recommendations made

Now, the second part of the question is: does it matter?

If the filament life under normal operating voltages exceeds 20,000 hours,
than dropping 5% and gaining an additional 18,000 hours, is probably
not going to result in a noticeable improvement in life.  Forever is
forever.

I looked at the site. The login requirements seemed a little silly
given that the information is available elsewhere on the web with no
restriction. They might have 'better' or more complete documents; but a
cursory glance across several google links indicates anything needed for
the OP's purposes is freely available elsewhere.

FYI, FWIW...

Well, that is, kinda, why I was trying to bring the discussion FROM the "manufacturers recommendations" (on large populations) TO what is everyone noticing from their own (multiple) amplifier experiences and what everyone else yaks about in terms of their own (multiple experiences) with filament power tube lifetimes.

Yeah...20,000 hours is a whole lot of ragchewing. I think I never in my life spent more than about 10-15 hours/week with amp filaments lit up. Today, I have the 813 filaments on about 2 hours a week (and drive the pair with a single 811 in gg and it's filament is on, also, and not not voltage managed, either). And, I've never blown an 811 filament, ever, and I had a few of those tubes in amplifiers, too.

FYI, FWIW

If we extend the universe of tubes observed to the TV and radio types, I would have to say that it is very rare for me to find a burned out filament in the 6.3 and 12V tubes. And very common in the very delicate 35-75V tubes used in series string sets.

Well, my comparable experience is the ac/dc AM/FM radios (12 v and 35 v tubes) and in another post I mentioned buying up a number of them at a couple of hamfests (and a thrift store) and finding that they all still worked AND had the original tubes (marked with same brand as brand of radio) in them.

But, the series string strategy was obviously the "cheap" way for manufacturers to save on the price of a power transformer AND any irregularities in the filament mechanical tollerance contributed to early

failure, which, of course, contributed to pressure on the consumer to buy
a whole new TV or radio, thus contributing to the nation's economy (if you
get my drift).

It can happen, but probably your good luck was the result of the radio
not seeing much use. Does it show signs of obvious use?

The 35 - 117V tubes have a large hank of zig-zagged very thin wire
as their heater. The wires come to a sharp V which isn't a good
idea. I have almost never found a 50V tube that was good.

The AA5 tube lineup was definitely an economizing move that could only
happen in the US. At one point, GE put everything in two tubes: one compactron,
and one rectifier/audio output tube...if I recall correctly.

Lots of dust, but looks mainly like there was never much moisture present.
However, I have one old Zenith with lots and lots of wear on the knobs,
loosness to the knobes-shafts, and it has all the original tubes, too.

But, by the way, I've had a lot of tube/transformer as well as ac-dc
radios and never had a tube blow out. Yeah, I know, it can be luck.
Certainly it was different with tube TV sets wev'e had where we had to
replace a tube every six onths because of brightness/constrast weakness,
or vertical/horizontal roll, etc., problems.

Yeah, and I was a little bit against that for the reason that if you had

three functions in a tube and one blew out, you had to replace the whole
tube. Probably cheaper to manufacture, but I never looked up the prices on
the compactrons vs one/two function tubes, do you recall any?

Also, its harder to find compactron sockets and they seem smaller spacing,
so harder to repair.

FWIW, I'm phasing out of miniature tubes in favor of
octals because they are much easier to work with, solder, put VOM probes
on, and with octal keys easier to put into sockets and take out of
sockets, and I thing the glass envelope should be a little cooler since
comparable heat is dissipated over a larger surface area.

Thanks for your comments.

Hello,

I'm in need of a couple of knobs for a Marconi CSR-5A receiver. These
are the groved ones that are on the RF gain, etc.

Regards,

Jim

NU6AM

Hello All,

One year ago, I made the NB6GC / KO6NO Remote Adapters for the RF-350 and RT-1446 available. Thanks to all the RF-350 owners who purchased adapters and eproms during the year, I am down to only four assembled and tested units and don't plan to assemble any more. I am now going to offer the eleven remaining circuit boards and parts as kits. If you don't mind soldering, you can build your own adapter for $30. Visit my web page www.ko6no.com to place orders. Thank you all and 73.

Ken Fowler, KO6NO

BTW. On recent trip to the Middle East met someone who said they have
a complete WS19 kit except for (I think he said the 'variometer'!) but
including power supply etc. Also understood that he might be
interested in selling it. Don't know which mark of WS19 it is; since
it is 'back home' in Canada; probably a Mark II?
I can probably re-establish contact with him through a relative also
working in the Middle East. Let me know if anyone interested.

Hi Chris: Agree. I worked on one WS19 when in the Army Cadets some 50+
years ago. Just the set itself the military hadn't provided anything
else! Got it transmitting a few watts into a lamp dummy load antenna.
Was probably a Mark I; it also had the Russian markings. Terry

It depends on what you actually need. Some of the information is
available elsewhere, but that site covers a lot more than just
the WS19.

The login requirements are there in an attempt to deter the freeloaders
who sell CD "collections" of manuals on eBay. A lot of work has gone
into that particular archive. (Scanning and cleaning up old documents
is a very time-consuming process, not to mention the problems and
expense of getting the original manuals to begin with.)

Chris.

That would make it a US or Canadian manufactured Mark II or a
Canadian Mark III, which were the only ones with Russian/English
markings. (Britain and Australia had none to spare for export.)

Chris.
p.s: A friend has an R107 with the bottom panel securing bolt in
place. I intend to measure this to within an inch (2.54 cm.) of
its life the next time I go to London, so I can make three of
them up - I assume you still need one for your set?

Unfortunately, the "partly stripped" R109 that a friend has is lacking
the entire power supply module, so no luck there. (Also, he's planning
to restore it, though that may mean something a little more modern in
the way of a power unit since there's nothing ther to refurbish.)

Once it stops raining (with occasional showers of hail) I'll photograph
the supply unit in my R109.

Chris.

Check out a few other resources. I didn't notice a single important
document on that site not available for free elsewhere. In any case,
the OP was only interested to the point where he could find someone to
take it off his hands, for price of shipping (probably a considerable
sum these days).

Maintenance EMERs?

How about EMER Tels JY 112/2, JY 113/2 and JY 114/2, which are the complete base workshop manuals for servicing that particular model?

>In any case,
>the OP was only interested to the point where he could find someone to
>take it off his hands, for price of shipping (probably a considerable
>sum these days).

And when someone suggests a (free) source for the manuals relating to
the set, you suggest there are better placers to look without offering
a single concrete alternative.

Fine. "Everyone has a plan which will not work."

Chris.
(Yes, I'm involved with the site in question (and the Yahoo! group),
and it's run as a _service_ to anyone interested in the equipment,
etc. at no cost to them (and considerable cost in time and money to
the site maintainers. </Declaration of interest>)

Looking for a set of good knobs from a Lafayette HE-10 / KT-200 receiver,
or similar from a HE-30 / KT-220 receiver. I need a set of good main
tuning knobs, and the tiny knobs used for the BFO and S-Meter zero.

Regards

Pete, k1zjh

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday April 20th 2008
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held on Albany between Mass Ave and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776 (M-F 9-5)

********** $1 buyers discount with hard copy of this notice ************

<FF>

Mail the coupon below by the 5th of the April to be a Prepaid Vendor.

About 5 or 6 months ago, an unused MK
II, complete with spares and mounting
hardware for a Sherman tank went for
about $500 plus shipping from the UK to
US. Heavy weight.

And yes, I'm sure that you know how to use Google. Everyone does, and
I'm sure the OP already has.

Enter 'no. 19 MK II' and see the thousands of hits, including a
worldwide directory of surviving sets, in one site. Organizers of said
site also obviously spent considerable time and money putting it
together. They don't require people to expose themselves to potential
identity theft in order to access this info.

I'm sure you already know this. You're making yourself look incompetent
and uninformed about a subject about which you are obviously
passionate...why?

In case you actually are not aware of the plethora of information
available, I'll include one (actually the best) link:
<http://www.googleitfirst.com/>

Some of my kit is actually _in_ this directory, oddly enough.

I think you need to put down your crack pipe and open the window
to let the fumes disperse. It's a Yahoo! group with a website,
like all the others.

>I'm sure you already know this. You're making yourself look
>incompetent and uninformed about a subject about which you
>are obviously passionate...why?

PKB

I suggest you read the thread from the beginning, and see who
is looking foolish in this discussion. Here's a hint: Someone
posted a link to the (.uk) WS19 group as a source of information,
and you jumped in with a putdown claiming "all the 'important'
information was freely available on the internet", which I
called you on.

>In case you actually are not aware of the plethora of information
>available, I'll include one (actually the best) link:
><http://www.googleitfirst.com/>

My apologies, I regret that I find it unethical to enter a battle
of wits with an unarmed opponent.

HTH, HAND.
Chris.

I do find the arrangement a little bit cumbersome, but I understand the issue involved.

That said, I got the proffered No. 19 set, and I am not exactly sure what I am doing yet, but the basic design of the A set seems reasonably straightforward.

The unit has had the meter gutted and wires soldered the the Pye connectors in order to hook it up.

So, I guess my FIRST question is what the meter movement is. I gather from the schematic that it's an ammeter but I don't know what resistance or full-scale current.

And my second question is where I get Pye sockets so I can hook up a couple bench supplies.

Looking at this, it appears to have been badly butchered over the years, with a lot of substitutions made. I don't think I am going to have the time to get this one up and running for Field Day. This year anyway.

Offhand, the meter os 0.5 mA FSD, scaled 0-15 and 0-600. I'm not sure what
the internal resistance is supposed to be (all the ones I've just looked
at say "WS19 Voltmeter", which is not exactly helpful[2].

I think the US meters were made by Weston, Triplett and possibly Simpson(?),
and there should be spares floating about on the surplus market still.
(There are some NOS ones on ePay, but at very silly prices.)

>And my second question is where I get Pye sockets so I can hook up a
>couple bench supplies.

Ah... by "Pye sockets" I assume you mean the power and control ones?

("Pye connector" usually means the antenna connectors, which were used
on all sorts of kit.)

Can you get the solder cleaned off the pins, or are you looking for replacement power and control plugs as well as the sockets? I've got a few spares but am on the wrong side of the pond so shipping will take a while...

>Looking at this, it appears to have been badly butchered over the years,

You haven't seen some of the ones /I'm/ considering rebuilding[1] - that one looks positively mint by comparison.

It's good to have a hobby.

g,d&rlh.

Chris.
[1] An AGI-built Mk.II with an ATU built into the 'B' set space, all the connectors replaced, extra controls here and there, and the switches painted with fluorescent orange fishing-float paint. The other one (a Pye built set refurbished by Roneo-Vickers (I think) in the 1950s) has other strange things (like an EF80 with 6V MES bulb as heater ballast mounted horizontally under the chassis where the 'B' set Tx/Rx relay used to be) done to it. Finding original parts to restore the 'B' set will be the tricky bit, I think.

[2] Apart from the one in the AGI set, which has been replaced by an Air Ministry 0-500mA thermocouple RF ammeter. <Cringe> I assume this is part of the built-in ATU addeed by a previous (SK) owner.

Up for sale is a Globe Chief 90a CW rig.
This rig was used by my father until he passed away and now I have it.
It is in good shape with some minor wear. It powers up but that's as
far as Ive been able to get into testing it.
I will accept all "Reasonable" offers.

Thank you all and god bless.

Carl.

Okay, so I can try a generic 0.5 mA meter out of the junk box and probably expect it to work. I can do that.

>Ah... by "Pye sockets" I assume you mean the power and control ones?

Yes! Also, the "key" connector appears to have more than just key contacts on it!

>Can you get the solder cleaned off the pins, or are you looking for replacement power and control plugs as well as the sockets? I've got a few spares but am on the wrong side of the pond so shipping will take a while...

I can easily clean the solder off the pins; I have an SMT workstation with the hot air and vacuum stuff. So I just need the sockets.

>
>It's good to have a hobby.

So, since I have just the single No. 19 set with none of the accessories, what is the easiest way to use it? I can take the antenna lead off to a

roller inductor and then to a long-wire antenna, no problem. I can easily
use an existing power supply to drive it, or build one out of junkbox parts
if I can get the connectors.   How do I connect a headset, mike, and key up
elegantly without using the outboard box?

It incorporates a switch to put the set onto transmit when the plug
is inserted. It takes a standard 2-pole jack plug, but....

WARNING! The key operates on the +250V supply to the buffer stage,
so you need an insulated key, and an insulated (no exposed screws)
jack plug. Otherwise you will get a nasty belt and there will be
a considerable amount of cursing (or worse).

The "official" key is "Key & Plug Assy No.9", and is well insulated.

One each, 6 & 12 pin... I can do that. Also a Pye connector (or two)
for the aerial connection.

Aerial metering is done by a current transformer in the variometer, so
you'll need to add something to replace that: thermocouple ammeter or
a modern ATU with metering.

> I can easily use an existing power supply to drive it, or build one
> out of junkbox parts if I can get the connectors.

Only 4 of the power connector pins are needed:

+12V DC @ around 4 to 5 amps for valve heaters and relay
+250V @ 120mA HT1 (Range 250 to around 275 volts)
+500V @ 50mA HT2 (Range 490 to 540 volts) (for the 807 PA stage only)

> How do I connect a headset, mike, and key up
>elegantly without using the outboard box?

The mike and headset connections all come out on the "control" plug,
along with the Tx relay line. Best bet is a short cable to a diecast
box with suitable connectors, unless you've got an original headset
in which case wire a snatch socket straight into the 12-pin socket.

You may also want to pull the "No.10 control unit" trick at the same
time. This converts the intercom amplifier into a microphone preamp,
so you don't need to shout into it.

The set takes a dynamic microphone, and low impedance headphones -
up to about 7 pairs can be used, so anything from about 50 - 300 ohms
should work OK for the headset output, and 300 - 600 ohms for the mike.

The reply-to addrss is valid, let me know your postal addess and I
can send some useful bits off tomorrow morning.

Chris.

I recently ended up with two DX-302 receivers, needing but one to be an SWL gift. I don't need the second one and will therefore sell it for price paid. The unit works well and is clean. The only issue is that some benighted soul elected to scrawl their name on the side of the receiver, on the panel bezel (jpeg if interested). Again, it works well on all bands, even VLF. I have some downloaded tech/operating information but no original book. The frequency/band tuning scheme was a puzzler to begin with but when you know how it supposed to be done, no issues. Price is $60 (cheap) plus actual postage/shipping from MD, by whatever means you direct. Thanks de Jeep/K3HVG

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday April 20th 2008
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take place on the third Sunday of each month this summer, April thru October.

There is tailgate space for over 600 sellers and free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if you're lucky enough to have a copy of our ad) and sellers spaces are $20 for the first and $15 for each additional at the gate.

The flea will be held on Albany between Mass Ave and Main streets in Cambridge; right in the Kendall Square area from 9AM to 2PM, with sellers set-up time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which offers a 30% discount. By prepaying you get a discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening

for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776 (M-F 9-5)

********** $1 buyers discount with hard copy of this notice ************

<FF>

Mail the coupon below by the 5th of the April to be a Prepaid Vendor.

FLEA at MIT 2008 Rates

SELLERS

To use your prepaid spaces the named vendor MUST be present.
Rates include one admission per space.

Season Pass Sellers admission to all seven meets this year
$99 First Space
$70 Each Additional space
Must be received by April 20th.

Advance $17 First space
$12 Additional Spaces
Must be received by the 10th of the month.

Gate Admission $20 First Space
$15 Additional Spaces
Admission is after the prepaid vendors.

Early Bird Buyer -Admission after the prepaid vendor line is admitted. ~ 7:15AM
** You may not sell. **
$15 per person at the gate.

Thanks, Gregg.  That's the same source
that I found.  I'll just go to eBay with
the information I've acquired, along
with a filament continuity check, M-V
anecdotes from my early days, and see
how they move.

Sorry for the somewhat off topic reply but does anyone know where I
could obtain a vibrator PS for an AR88 or CR91 ? It doesn't have to
work as long as the transformer is ok. Also looking for a rear apron
cover (4in. by 17in.) to fit the desktop cabinet of an AR88.

I also have a parts chassis with IFs, iron and an intact tuning unit
with gear drive if anyone has need of a few odds and sods.

TIA

Kevin

Build your own. Use a center-tapped filament transformer wired in reverse as the vibrator transformer. You may have to try several to find one that is efficient at the high frequency. In general, don't even think of big toroids which are often designed specifically to be lossy above 60 Hz.

I have a four-pin 6V vibrator sitting here that you can have. It does not work; probably just needs contact cleaning and burnishing.

Hi All,
Sorry to post this again, I lost the replies from the last posting.
I need a complete set of knobs for the Philco 38-10. It is a small
wooden bullet set, it has the 3 regular (circa 1938) Philco knobs on
the bottom row and the 2 part Philco knob on top with the knob and
skirt type assembly. Originals or reproductions will be fine. Anyone
know where I can find these?
rgds,
Mark S.

Larry Bordonaro at www.antiqueradioknobs.com  has the repros.   The lower
knobs are the most common type of original manf. radio knobs of the 30's,  I
have those in stock.  The two pc tuning knobs are less common but still
easier to find than any other brand, since Philco sold so well.  I have
originals of those in stock too.   You will want to change out the pilot
lamp socket rubber to a fiber washer.  I also stock the RF deck mounting
washers, and I have the repro dial for that model if needed too.

I once had this problem with an old SB 401 xmitter. It turned out to
be the meter shunt resistors in the final amplifier tube cathode were
burned to near zero resistance. This caused zero indicated plate
current but a normally functioning xmitter otherwise. The plate
current was actually normal but the shorted resistors produced no
voltage for the plate meter.

Hello, I have this Hallicrafters Model S-20 With Fly Wheel Tuning it has been completely Refurbished, The Cabinet Was Repainted and Restinciled to match Original. All The Caps and Resistors Replaced where Needed. This was Professionally Done 5 Years ago, and it has been sitting in my collection of other Hallicrafters Receivers that I collect. I have decided I want a SX-28 Or SX-28A and a Working One in Clean Condition will cost about $500.00 to $600.00 I don't have that kind of Money for a New Toy, So I have decided to sell one of my Nicest Receivers I own, to get a SX-28. I will sell this one for $450.00 or Swap for a SX-28 or SX-28A Model that is working and Clean, It doesn't have to be Restored. Email me at alandoss@hotmail.com or Call me at 1(530)938-4232 and ask for Alan.

How long after applying filament voltage till the 813 is ready to transmit?
Is it like a 3-500 or do I have to wait 30 seconds or so?

Wait at least 30 seconds. The 813 doesn't have instant heating filaments
like the 3-500z.

The 813 filament is constructed of thoriated tungsten. One of the characteristics of this type filament is "instant" on.

See http://www.w8ji.com/vacuum_tubes_and_vaccum_tube_failures.htm   and look under thoriated filament.

You do want the filament to heat up and that probably means a second or two. I remember Bill Orr wrote an article about failure of the 3-500 (which is considered instant on also). Some individual had a number of tubes fail and kept sending them back under warranty. Finally Eimac called him and learned that the chap was turning the tube filaments off between transmissions and turning them on immediately before each transmission.

So, do not use either tube for break in cw by keying the filament.

73, Colin K7FM

I have to wonder what the keying waveform might have looked like.
Probably added a unique sound to his signal. Something like a modified
banana-boat swing, for lack of a better description?

When the glow is up to bright orange, then you are ready. If you apply the filament voltage without "management" (i.e. a slow increase over, say 5-10 seconds), the tube should be ready for transmit in, like, about 1-2 seconds. In a heater cathode (rather than a filament cathode), you need to wait for that thin "coat" to come up to a dull orange and that can be half a minute or so depending on the tube.

For sale: Viking Johnson Ranger

I bought it at a hamfest a number of years ago ('03?) when I was phasing into retirement and thinking of doing some kind of a restoration and had partial success with this. However, I have gravitated to a different kind of retirement ham hobby activity: total or almost total homebrewing. Thus, I'd like to find a new home for this Ranger.

Caveats: It has some major internal problems, The guy before the guy I bought it from had totally torn out all of the CW circuitry. Also, the modulator was converted from 2x1614s to a pair of 2E26s. The modulation transformer is unknown, hermetically sealed (black pot), and of a brand name I've never heard of, and larger than the original, AND located on the opposite side of the chassis. This guy also converted the speech amplifier to a big mess and a phase inverter driver for the 2E26s. Also, as part of this job, he tore out the 5V4 (?) and left the 5R4 thus making it all 500-550 vdc and no low voltage. To get low voltage (for VFO and 6CL6s) he used power resistors in series with low voltage load and connected the top to the high voltage supply. He also moved the VR tube to where the crystal socket was. The power transformer and large choke seem like the original.

At the time I aquired the rig, the electrolytic was dry (hum on carrier looke like 30% on a scope). I made a kludge repair on that and drove the 2E26s with an outboard hi-fi amp and actually had the rig on the air in several AM contacts on 160 and 75. The VFO does not jump frequency (I had this problem on an earlier Ranger many years ago) during or after warm-up, at least to the extent that I monitored this. I have observed a spur coming sometimes from the 6146 driver (in standby, swishing through the driver tune knob, get a herterodyne in a receiver).

My own mods included two mini-toggle switches near the function switch (which needs cleaning and oil). The meter is OK, but the meter switch needs cleaning, too. I added a DPDT relay run off the 110 vac as part of a plan to change the manner of control of standby to transmit and back. Off the back panel I've added banana jacks for certain outside "port" connections, and one of those European-type female chassis plugs (three prong) that you see everywhere now for AC-in. I also tore out the power line filter (caps to ground & series inductances [I've gotten mild shocks off all of this old gear that put those things in under the 'old ways' GMPs, but I think they are basically useless]). The cabinet cosmetics are probably, IIRC, closest to "very good" in terms of few scratches/wear and barely any rust or corrosion anywhere (except some on some surfaces of the transformers/chokes).

There may be some other minor issues but I can't think of them just now.

So, you could look at this as a restoration to a less-than-original state or a spare-parts source. I paid $200 for this, but I paid too much. I guess its worth $50, now, and I think I don't want to ship it. I'm in southern Delaware and not in a hurry to get rid of it but would like to free up some space in my hamshack and get it into someone's hands who is wants to do the restoration I was going for (just AM capability), or whatever. So, I'm willing to drive one way about up to one hour in any direction to some "half-way" point away from my home. Manual reproduction comes with. There is also a Georgetown, DE hamfest on April 12, here (at Sussex Tech HS), and could meet someone there, too.

If you are interested then email me and tell me your story (in case there is more than one person interested who can meet me within my one hour driving radius of Georgetown, DE). Respond to the email address originating from this post, but if I don't answer within 2 days, make a followup post and give your email address in that post (I have spam filters but simple email usually does get through).

Note that slow turn-on will radically increase the lifetime of these tubes
if you're using them below full power level. An inrush current limiter
in series with the filament only costs a dollar or two and can easily pay
for itself a hundred times over.

An inrush current limiter
> in series with the filament only costs a dollar or two and can easily pay
> for itself a hundred times over.

Hang on here. Do you know what 813s cost these days? Still only around $10
!!
I got two at a hamfest last week. Got them hooked up to a filament xfmr,
and let them cook for an hour.   Boy are they sure beautiful sitting there
glowing in the dark. They seem to be saying to me, "Hey we've been waiting
for 60 years to get a chance to make some RF!"
I also have 2kv waiting. So next step is to jury rig them up and see if
they draw plate current, with a little bias control, before I commit to
putting them in a new homebrew amp.
Since I just finished an 8877 amp this winter I am a little cautious and

aprehensive about hamfest tubes, because when I first fired up the 8877 with
4kv I got just that - fire. Seems the "I think it is good" tube a guy gave
me actually had a grid-plate short. Took a couple weeks to clean up THAT
mess. Fun stuff.
Thanks for all the replies, OTs.

>
> Note that slow turn-on will radically increase the lifetime of these tubes

1. I recall a research topic handout mentioned in a QST from maybe 2 decades ago that said this but did not give actual numbers. Does anyone have something specific in terms of what they call "radical"?

2. I also recall relatively little _actual_ discussion, from my SWLing days on the ham bands 50 years ago, of people complaining about blowing out their filaments sooner than they would be happy about, so do any of you guys have any real life experience with this (instead of passing on "conventional wisdom" that has been passed on as conventional wisdom by everyone else that passes on conventional wisdom)?

3. Usually tube/filament lifetime is something like "insurance" statistics. There will be an "S"-shaped curve with some characteristics and this means a lot of filament lifetime experience will only show up in fairly large populations.

4. For the record, I bought, some years ago, three Chinese 813s, brand new, and after six months, one of two of them blew a filament (I barely noticed it since at the end of the QSO I noticed my plate current was running half of what is should have been) in my pair-813 linear (with variac on the filament transformer).

5. Inrush currents will often be, already, limited to some degree because filament cold resistance will be lower than hot resistance and most of the secondary voltage will appear across secondary resistance which will be almost identical either warm or cold. For power transformer powered linears (etc), the HV is dumping into a string of electrolytics thus building in, perhaps, 100-200 (?) milliseconds of "delayed" or "limited" inrush current because that part of the transformer is temporarily "overloaded."

6. How many of you guys with 3-500Z and 811 amplifiers (572-Bs, 4-X, etc, and there are a lot out there) are replacing one or more of your tubes every year or two because one or more filaments won't light up the next time you turn on your rig? How many of you guys have the same tubes in your amplifiers for a decade or more and the filaments are still lighting up just fine and RF output (and not on "pushed" tubes, either) is also just fine?

Guys, how about some extended discussion on this? And, I've had a few of all of these tubes at one time or the other almost since the beginning of my haming before 1960 and never lost a filament till the Chinese 813.

P.S. The Chinese 813 had crappy soldering work on the pins at the bottom
of the tube, too. The other Chinese 813 is still running fine. I have some
Chinese 811s, too, and their pins are better soldered. Russkie 811s look
and work fine, too. I replaced the burned out 813 with a used 813 from a
hamfest (an old brand I forgot) but it has a darker "tinge" inside, but
the RF amps out are just fine.

On the 813, I don't know. But Eimac used to have a little handout on
filament regulation of their planar grid tubes; it talked both about
small static increases in current severely shortening lifetime as well
as inrush current issues. It's worth looking up and is probably on the
Eimac website.

>2. I also recall relatively little _actual_ discussion, from my SWLing

I usually lose filaments before I lose emission on power tubes, but I tend to run well below rated power. If I were running at rated power, I might feel very differently.

>3. Usually tube/filament lifetime is something like "insurance"

This is probably the result of a manufacturing defect in the filament, and inrush-current limiting may not have done much good anyway there.

Could well be... the sag due to charging the caps could well provide effective soft startup. It might be worth measuring to see.

>6. How many of you guys with 3-500Z and 811 amplifiers (572-Bs, 4-X, etc,

I would suspect more people lose tubes due to bad emission than to filament failures, but I also suspect people tend to be running finals hard out there.

Which factory did the Chinese one come from?  I have had nothing but trouble
with Shugang products, but I don't know if the 813s are from Shugang or not.

> 4kv I got just that - fire.

Fuses in primaries and secondaries of plate transformers are your friends.

Variacs feeding the primary of the plate transformer (and with an ammeter) is a good idea if you start out with low voltage on the primary, and pay very close attention to all of your meters.

It is better to have more meters than not enough meters.

Sometimes an ohmmeter check on pins of tubes, BEFORE you do the smoke test, is wise (I have done smoke tests where I got smoke, too).

Seems the "I think it is good" tube a guy gave
> me actually had a grid-plate short.

I have had the experience, at hamfests, where, after money goes to the guy and the thing goes to me, then he tells me "Oh, by the way,..(fill in the blank)...."

Took a couple weeks to clean up THAT
> mess. Fun stuff.
> Thanks for all the replies, OTs.

After deciding to build a linear, the decision came down to the 813 for the following reasons:

1. Large glass tubes need no special socket or chimney.
2. Tube manual says no forced-air cooling is needed.
3. Sockets are cheap. Plate capes are cheap.
4. Tube is cheap.
5. Filament cathodes are "instant on" whereas heater cathodes need warm-up time.
6. Large tubes generally mean old-fashioned large grids and that means a larger margin for error (i.e. overloaded grid dissipation) than those new small sexy expensive small metal-ceramic tubes with dinky, flimsy, small grids that vaporize if you accidentally overdrive them for more than 1-2 milliseconds (I've heard guys talk about this on the air).
7. I have no fan on my 2x813 G-G amp, and it is very nice and quiet (unlike three other commercial linears I've had with objectionable fan noise).

Pictures of some of my stuff at: http://w4pon.freeshell.org
Not all that pretty but it all works and I know how to fix it because I built it.

I recently saved this radio from being trashed along with a
Hallicrafters S-38. Here is a picture of the MK II

http://i88.photobucket.com/albums/k162/astouffer/boatanchor1.jpg

Its very dirty and missing the meter on the front and probably 2/3 of
the tubes. It doesn't look like any of the original components have been
changed. If anyone is interested I can see about getting it boxed up and
letting it go for the cost of shipping. My zip is 15112 and Fedex ground

seems to be the cheapest for stuff like this. One question I do have is
why the dual russian/english labels on everything?

Adam

If you are firing up the tube for the first time in many years, let it bake with full filament voltage for a few hours to allow the vacuum to stabilize and degas.

After the initial baking session from then on a second after filament voltage is applied, you can apply all voltages for transmit.

Adam

I worhed on these overseas in Europe during WW2..
Amongst other duties, I installed these in tanks that were
being shipped to Russia from England as part of our Allied
effort in 1942.   k35454.

I have done that and all still appears well. Even found a 10 volt, 16 amp transformer
in the junkbox. Before I commit to using these tubes in a HB amp I will see if they pull
plate current, and use a grid bias supply to control current. I have a variac to control
plate current.
Tnx

I recently saved this radio from being trashed along with a
Hallicrafters S-38. Here is a picture of the MK II

http://i88.photobucket.com/albums/k162/astouffer/boatanchor1.jpg

Its very dirty and missing the meter on the front and probably 2/3 of
the tubes. It doesn't look like any of the original components have been
changed. If anyone is interested I can see about getting it boxed up and
letting it go for the cost of shipping. My zip is 15112 and Fedex ground
seems to be the cheapest for stuff like this. One question I do have is
why the dual russian/english labels on everything?

Adam

I worhed on these overseas in Europe during WW2..
Amongst other duties, I installed these in tanks that were
being shipped to Russia from England as part of our Allied
effort in 1942.   k35454.

And if you google Wireless Set No. 19 you will
probably find people in Ontario, Canada who couldaccept
the parts.   K35454.

It looks like just dust accumulation, rather than corrosion, so is
eminently restorable. Meters are not hard to find, nor are the tubes.

> It doesn't look like any of the original components have been
>changed.

It should be good, as long as the bottom cover is in place - they tend
to be a bit hard to align if that's missing.

Someone will be getting an absolute bargain 8-)>

> everything?

Lend-Lease production for the allies. They were not used by the US Army (despite the "Signal Corps" on the id plates) who had their own kit like the BC-603 for tank use. The WS19 was designed in England by W.G. Pye and built by them initially (with other production by companies such as AGI (Aeronautical & General Instrument, E.K.Cole & Mitcham Works). The Mark II set was needed in much larger quantities and was contracted out to the US (Zenith, RCA & Philco) and Canada (RCA Victor, Canadian Marconi and Northern Electric) as well as being made in the UK by Pye, AGI and others (plus Australia for their own use by AWA).

A Google search will probably turn up more than you could possibly want to know about the subject. 8-)>

Best,
Chris.

There's an article on BAMA discussing a GG 814 amp. Its a rather large
download for me so I haven't looked at it.

Yes, there was ONE and it went for $50 dollars, a little too rich for
me.  I got a Realistic speaker, same color as my old HE-10 receiver
and am touching up the paint.  Only $9.99!

RCA took out an ad in the 1942 Radio Handbook. This, of course, was a wartime publication.

The title to the article is "How to make transmitting tubes last longer." They state:

"Long life - not maximum output - is the keynote of transmitting tube operation today in many services where, because of war restrictions, it may prove difficult to replace tubes that wear out. For tube types using pure tungston, a 5% decrease in filament voltage will dobule tube life... Care should always be taken in starting up tungsten filaments. Never should the filament current exceed, even momentarily, a value of more than 150% of normal.

For types using thoriated-tungsten filaments and oxide coated filaments, the filament may be operated on the low side - as much as 5% below normal voltage if the loading is light. The filament voltage should be increased gradually to maintain output. Toward the end of life, additional service may be obtained by operating the filament above its rated voltage."

The 813 has a thoriated-tungsten filament.

73, Colin K7FM

Hi K3HVG

I do not know the exact size as the knobs on my AR88 are nothing like
the original, but they should be the small ones that are about 25mm dia
at the base of the knob.
I hope that info is of help to you.

Regards

Bill

Bill, It appears that I have a number of the required knobs. What is
your address?

I need the four skirted bar knobs for the NCE (similar to the NC-101X)
that are engraved "TONE", "AUDIO GAIN", "CW OSC", "RF GAIN", and the two
unskirted bar knobs that have the small metallic pointer on one end.
Also, I need the can electrolytic that has the 3/4 inch screw mount on
the base (need not be operational, as new caps are installed underneath
the chassis, as this is just for show).

This is for a radio in the collection of the California Historical Radio
Museum Jim Maxwell memorial ham station W6CF.
See www.californiahistoricalradio.com

Reply to john@w6bm.com   (museum trustee and board member)

Thanks.

The key issue which is not discussed at all above is that you have to look
at _some_ sample population to see the effect of lower filament voltage on

increased filament life. The question I ask, again, is how many guys out there with filament cathode power tubes have had filaments blow out (compared, say, with decrease in power output, or internal shorts that blow fuses) in some manner that one might hypothesize is due to filament warmup being too fast. Remember, I had one 813 filament open up on me even though I was going from zero to ten volts, slowly over about ten seconds, and on a Chinese 813 about one year old. So, I conclude, on a sample size of one, that a filament can blow even if you raise filament voltage slowly. Oh, yes, I also slowly decrease filament voltage to zero, too, when I shut down the station. And, I'll remind everyone that I've had lots of amplifiers in my ham career, and with no inrush protection, and never lost a filament. I'd still like to hear from others about this.

Regarding higher filament voltages, I remember as a kid that we had a TV set where the picture tube cathode emission deteriorated after some years of use thus causing a weak picture (white areas were gray, gray areas were black) and they had these little filament voltage boosters that caused the filament to heat up to hotter temperatures thust restoring cathode emission for some unknown additional period of time (I think the voltage boost was from 6.3 vac to maybe 7.5 or so) since a hotter filament should burn out sooner. Interestingly, we were still using that TV, every night, for another three years. Again, a sample population of one. However, the picture brightness did come back to fully normal levels.

In my own goofing off, I have raised filament voltage on a 6.3 v expendable tube up to 18 volts, over a period of about one minute, before it blew out the filament. It got quite bright. I have had momentary mistakes where I have put 12.6 volts on filaments of 6.3 volt tubes for periods of 10-20 seconds (turning off when seeing the filament get abnormally bright) with no apparent effect on tube lifetime. Sample size: maybe 3-4 tubes.

I had, once long ago, a tube hi-fi amplifier on which I put a variac and was somewhat surprised that I still got power output even with 85-90 vac going in, and over prolonged periods of time (Down at 75-80 vac, audio droped off and distortion came up).

Surely there are a few people out there who have done some actual (experimental) playing around with their tubes and can tell some stories instead of passing on technical rumors.

I have a National NCX3 that powers up and receives some but I think output
is pretty weak. I'd imagine it needs tubes. The main tuning dial slips too.
It has the matching power supply/speaker combo.
It's heavy.

$80.00 plus actual shipping to the 48 states.

My Collins KWM-2 uses a home brew power supply. Step start on filaments - at correct voltage and no high voltage for 60 seconds. Same tubes in it for 30 years. I think the only two power amplifier tubes that failed were dropped on the floor. Some amplifiers adjusted the filament voltage to be correct and some were never measured.

I ran a 3 x 813 amp for years and never changed the tubes or even measured the filament voltage. Just used a transformer with the rated voltage and called it good. Unless the filament transformer has a current rating much higher than the demands of the amplifier tubes, the surge will probably be ok.

Incidently, the home brew equipment looks practical. I built a vfo using the Collins 70H3. The problem with it is that it covers 1.5 to 3 MHz with 10 turns. That is 150 kHz per turn. Bad for a linear dial. I used a 8:1 reduction gear and a crystal controlled mixer to cover 5 to 6.5 MHz, then limited use to 5 - 5.5 MHz. That was coupled in as the second vfo for my Drake TR-5, so when I switch it in, the Drake digital dial displays the frequency. Extremely stable. Oh, I converted it to solid state, also, which is easy to do. There is one minor problem in that there are no stops on the dial. Not a problem for me, but if some kid came in and started twisting, he could break something. Oh well, you need to take some risks in life.

73, Colin K7FM

The question I ask, again, is how many guys out there with filament cathode power tubes have had filaments blow out (compared, say, with decrease in power output, or internal shorts that blow fuses) in some manner that one might hypothesize is due to filament warmup being too fast.

If I understand your request, you would like us to abandon the advice of the tube manufacturers, and instead use our own anecdotal accounts of tube filament failures?

It is unlikely that any of us have run herd on as large a sample set of tubes as the manufacturers did. Clearly the chance of filament failure among transmitting tubes (or any tube for that matter) is pretty small.

If we switch our focus to incandescent lamps, an example of a tungsten filament with which we all have large experience, we could perhaps extrapolate that anecdotal experience to tubes in general.

If I eliminate the cases where I dropped, or thumped the lamp bulb (trouble lamps), I cannot remember a case where a household tungsten filament lamp has failed at other than turn on or turn off.... and since I have spend my life living with others, I cannot say for certain that those cases where I thought the bulb must have failed on turn off, weren't actually cases

where it failed at turn on for a house mate, and they didn't take the time
to replace the bulb, or feel the need to tell me about the failure.

If, however, we wish to ditch the anecdotal evidence, there is ample
statistical evidence, compiled by the lamp manufactures, to allow them
to come up with the following equation for tungsten filament lamp life:

[life at test V/life at rated V] = [rated V/test V] ^ 12

Using a 5% reduction in operating voltage, we get:

[life at test V/life at rated V] = [Vr/(Vr(1-0.5))] ^ 12

or,

[life at test V/life at rated V] = [1.05]^12 = 1.85

Which means by simply lowering the lamp's applied voltage by 5% we increase
its life by nearly 2 times!

Which fits very nicely with the wartime conservation recommendations made
by some of the tube manufacturers.

I cobbled up a two transistor oscillator, essentially copied from an
Atlas 210 Transciever schematic, to run the BG9D I got on Ebay while
back. The circuit is here:

http://novatech-instr.com/Fun/Crystals/bliley_q.jpg

I took an old octal based capacitor, emptied the insides and wound 106 turns (53 bifilar) of #27 wire on the aluminum case. This is the heater. About 1 amp heated nicely to 70C. I used some hot-water pipe insulator to cover it. An LM61 is used as a temp sensor. (epoxied to the can) (I'll put up the temp controller schematic when I remember)

It is hard to set much closer than about +/-1ppm (needs a better multiturn capacitor), but it is stable (short term) to better than +/-.01ppm. That's pretty nice, but other than the fun of building it, the performance is pretty useless. Roughly the equivalent of building a crystal radio set.

I am going to replace the transistor with a 12AT7, just for show, and call this little experiment done.

Steve.

I read your request and did some research on it..If the transmitter
tunes ok and is outputting normal power ,then it indicates that your
metering circuit is screwed up..When you go into transmit mode,a
relay closes,which in turn closes a couple more relays including the
meter switching relay ..Problem is most likely in the meter switching
relay itself..maybe contacts out of alignment,stuck,broken
dirty..whatever...This relay unit is # X43-1190-00 located in bottom
section near front center..I would pop the cover off the relay and
check the relay action as you key the xmtr..Spray both relays with
contact cleaner. If you plan to run the 820 and maintain it it you
will probably need a service manual.It is a good old radio ,BUT it
could be about 30 years old and may need some TLC from time to time..
Good luck Harold W4PQW

No, the meter pegs to the LEFT! I have to use an SWR/Power meter to get the
radio to tune up to 100 watts! Appreciate the comeback! Any other ideas?

I read your request and did some research on it..If the transmitter tunes ok and is outputting normal power ,then it indicates that your metering circuit is screwed up..When you go into transmit mode,a relay closes,which in turn closes a couple more relays including the meter switching relay ..Problem is most likely in the meter switching relay itself..maybe contacts out of alignment,stuck,broken dirty..whatever...This relay unit is # X43-1190-00 located in bottom section near front center..I would pop the cover off the relay and check the relay action as you key the xmtr..Spray both relays with contact cleaner. If you plan to run the 820 and maintain it it you will probably need a service manual.It is a good old radio ,BUT it could be about 30 years old and may need some TLC from time to time..
Good luck Harold W4PQW

I do plan to try and use the 820 from time to time, although I will primarily use my Yaesy 857D, but I would like to keep the 820 in top shape. I downloaded the service manual for the 820 and along with the help from your post I will see if I can get the meter working properly, if that is the problem. The meter appears to be working fine at all other times, in the other modes, but you may have hit the nail on the head with dirty/stuck contacts. Once I get some time (and the nerves) to pop open this rig and work on the relays as you suggested, I'll let everyone know if that was the cure. Thank you so much for the assistance!

If memory serves... and it's been quite some time since I owned my
TS-520 (which tunes similarly), in Tune mode, the radio is actually

using a low powered version of a CW tone. Seems to me that if the meter is lying all the way to the left when you flip the Send switch, that maybe your carrier gain is set too low. Find the knob for Mic Gain/Carrier (Again, going by memory) and adjust the carrier for more gain (I think it's the outside ring). Go slow, as you won't need a lot...

Pretty good, but not my idea of big files.  That starts with very full
CD images and up.  I do not bat an eye at downloading full multiple
DVD distributions of Linux.  I have dual layer rewriters and media as
well.

Just listed on eBay by an aquaintace not on boatanchors: a working CV-591
MSR-4 with covers & copy of manual.

Thanks for the read. Larry

Hi Folks,

These are "NOS" caps and would make an excellent 240 mfd cap at 4500 VDC all in series with the appropriate equalizing resistors. Each is 3" in diameter and 5 1/2 " high. Screw terminals. Made in the good ole US of A.

$75 for all ten plus shipping.

Chuck...K1KW

So I'm playing with an old AN/APR-4 radar search receiver. Kinda works right off the bat, if weakly.

Looking at the schematic, there's a thermostat and heater. Not too surprising, maybe they want to keep the oscillator coils warm.

Then I look under the chassis, and the thermostat is clamped between the two main power supply electrolytics. The heater is a resistance wire, wrapped around one of the 20-20/450 electrolytics.

WTH? Why would anybody go to the trouble of keeping an electrolytic capacitor warm?

Very puzzling.

Because electrolytic capacitors suffer an extreme capacitance reduction
when they get cold. At -10C, they essentially cease being capacitors.

If you will go to eHam.net there is some good info on using 3-400 &
3-500 tubes . I have owned several Drake L4B amps,all with 3-500
tubes ...I seem to remember seeing L4 `s with 3-400 tubes..I don`t see
any problem with changing from 3-400 to 3-500  If all(except fil )
pins are grounded .. GL   W4PQW

I read your request and did some research on it..If the transmitter
tunes ok and is outputting normal power ,then it indicates that your
metering circuit is screwed up..When you go into transmit mode,a
relay closes,which in turn closes a couple more relays including the
meter switching relay ..Problem is most likely in the meter switching
relay itself..maybe contacts out of alignment,stuck,broken
dirty..whatever...This relay unit is # X43-1190-00 located in bottom
section near front center..I would pop the cover off the relay and
check the relay action as you key the xmtr..Spray both relays with
contact cleaner. If you plan to run the 820 and maintain it it you
will probably need a service manual.It is a good old radio ,BUT it
could be about 30 years old and may need some TLC from time to time..
Good luck Harold W4PQW

Well, I finally took the case apart and flipped it over. I only saw the one
relay, and it APPEARED to function just fine when I keyed the mike. The
meter still pegs to the left when I try to dip the meter.

Howdy You All, I am looking for a Bottom Metal Cover for my Hallicrafters SX-16, Does anyone have one they want to Sell, and could someone with lots of Hallicrafters Knowledge let me know if any of the other Old Hallicrafters Receivers like maybe the SX-17 Bottom is the same, this will help me to maybe find one a little easier, Many thanks, 73 Alan. P.S. My email addy is alandoss@hotmail.com

All,
I had to have the 4" speaker from my Pilot T502-U re-coned because the
voice coil was shot. It's a sentimental set, I have spent a bit
keeping it up to par and this was a setback.

I used the Circuit Shop in Kentwood, MI. after reading about them
here.

They charged $35 for the re-coning (Professional!) and $7.50 for
excellent packing and quick shipping.

WOW!!! what a great job!!!

Installed the speaker and it is perfect!!

As you can see, I recommend them with all confidence.
They are at: www.circuitshop.com

Hawking of services completed
rgds,
Mark S.

Absolutely. I've had them recone two speakers for me so far, and both were
amazingly perfect. And very reasonably priced. I hope Jim and Richie are
teaching their craft to some of the younger guys and they stay in business a
long, long, time. Hawking is well deserved.

I'm writing up eBay auction material for
a pair of 6508 M-V rectifiers. I could
use a tube base diagram for them, as
well as some commercial or industrial
applications for these beasts. They are
rated 21,000 PIV @ 2.5 A which could
power a good-sized broadcast transmitter

```
in the 1940's or '50's.  Any help would
be appreciated.

> Would 3-400's be exact replacementsfor the 3-500's =A0in my L4B?

Sometime in the 60's, Eimac stopped selling 3-400's and instead sold the "upgraded" 3-500's as drop-in substitutes with higher dissipation.

I don't believe that 3-400Z's have been sold since the early 70's... of course someone might have them sitting on the shelf.

Most of the electrical parameters are similar between the -400 and -500 but of course the -500 has more dissipation. The intended path was that folks would put 3-500's in place of 3-400's - there were some slight physical changes and I think the 3-500's are supposed to use beefier anode clips etc but many amps using 3-400's just had 3-500's put in with no changes. I think the L4B originally had 3-400Z's.

Tim.

I get a similar error opening with Adobe Reader so it must be goofed up.
   It won't download at all.

But all the individual pages are there as gifs...at least on the Edibris
site.

     FWIW, there is a small free program for making PDF's
called PDF Creator, available at:
http://www.sourceforge.net/projects/pdfcreator/
     It installs as a printer and will make PDF's from any
file you can print. The image viewer in Windows will allow
combining pages to reconstitute the original multi-page
document as a PDF.

Hi Gang,

If'n ya want those guys to do your speaker reconing, better get with the program, 'cause when fishin' season starts around here, they fish more than they work :-). But that is, after all, what owning your own business is ALL about. They do EXCELLENT work for me and quick too, when it ain't fishin season.

This Sylvania industrial tube catalog has ratings only, and
sadly no pinouts. It does say the light beam can be modulated
up to 1 mhz. Pretty good bandwidth for old technology.

Hello, I need a Bottom Metal Cover for my Hallicafters SX-16, and I could use some Capacitors Rated at 30MFD to 33MFD and 40MFD to 43MFD Voltages of 150V to 600V, if you have some I sure could use them, and I need a Working S-19 or S-19R Receiver, if any of you all have any of these items, please email me at alandoss@hotmail.com or call me at 1 (530)938-4232 Thanks 73 Alan. P.S. I will Pay with Paypal, This is the safest and best way to Pay for both parties.

have a national hro 60-t. looking for the broadcast coils e and f.
can i use other coilsets from other models, such as a 50t? this would
improve my chances of course.... thanks all info. some of the other
models seem to have the same design/contacts tho the appearance may
differ -- metal tag or just engraved, grey or black etc.

===================
All the earlier "E" and "F" coils will work in your HRO-60.
Difference is in the appearance as you noted, but they will work fine.
I have a "J" coil from a HRO-5 that works in my HRO-60. It's the "A"
and "B" coils for the HRO-60 that are different from the earlier coils
as the HRO-60 is double conversion with those coils.  --Ed

I am looking for a service manual for a GALAXY R 530 RECEIVER. I have the owners manual, but it contains no service info. I noticed that PETE KE9OA was quite familiar with the R530 and was going to post an alignment procedure. any help on this project will be much appreciated.

Thanks   Doc K8RR

Hi

I am after 2 knobs for the AR88 - 2 tone/noise limiter type - any idea where I can get them would appriciated.

Bill Knox

I have considered replacing the steel cables with regular dial cord. I
have not got around to it yet but I think the idea has merit. One can
only describe the mechanical instability/microphonics as "Guitar
String" like. Otherwise the tuning capacitor layout is similar to
other receivers of the era.

Tony

It may be a little on the small side, since the Class 'D' only had a single valve in it.

I can also discount the SUR No.7 - I forgot the mainsd input option, and the transformer is *enormous* since it's got windings like this:

AC input

+10V 0V -10V 110V 140V 170V 200V 230V (to give 100 - 140V in 10V steps).

_or_

DC input

12V 0v 12V for vibrator switching. (Has a centre *and* an offset tap).

DC output

-80V 0V +80V at 30mA for teleprinter magnets

AC output

40V at 40mA for AC ringing on carrier telephony equipment

DC output

12V at 40mA (probably a relay supply) This is actually quite strange, because it's take of a *tapping* on the vibrator winding, and there's a lampholder betweeen the centre-tap and the "12V" takeoff point. I assume the "step up" is to compensate for the losses in the selenium bridge rectifier used in this part of the supply.

All in all, it's a strange beast.

Tomorrow I will dig out the complete Claas 'D' and the R109 that is
awaiting refurbishment, and compare the transformers. I may have
the appropriate EMER somewhere, which might have the transformer
winding details if I'm really lucky.

Chris.

I have my SX 100 mounted in a bookshelf and mounted a 117v muffin fan
to the bottom of the  shelf above blowing air across the top to keep
the temp fairly stabile after warmup. It has cut down the drift. I
also found that by not setting the speaker directly on top of the rcvr
it cut the microphonic tendency. This also was also true of several
other Halli's. These solutions worked for me and I did not have to mod
the units in any way. I think I would keep the steel cables because
they will last forever over dial cord unless you really trace down
noise to them. 73 Mike KF6KXG

Chris - many thanks for your information.
Whilst you have the covers off your R109,
would it be asking too much if you could take
a digital photo for me of the interior of the power supply layout, and send
it as an attachment in an email?
It would really help when I come to rebuild mine.

I once fabricated one using a brass keeper from an RC airplane linkage
kit. It's the part that secures the cable to a servo arm.  You might
also subscribe to the yahoo heathkit newsgroup.  There are lots of posts
in there.   73's   Mike K8MB

Dave , tnx, my ts511s has the various boards with a mixture of tubes
and transistors, maybe 8 to 10 tubes, 6lq6 finals and 6kg5 driver.
 an interesting fix - It had one problem after 20 minutes the 80 meter band
would go dead on xmt and receive, i cleaned all contacts bandswitches with
no help, when a replacement 6gk5 arrived for the low emission one, i
replaced
it and now everything works fine.  The readout is analog, dont know if there
was a digital model, however found references to a ts510 and a ts515 model.
 awesome receiver.
    will be taking to the cherryville NJ hamfest april 5th.
interested folks can contact me at wb3gnj@yahoo.com for info.
tnx jim kw3u

I am restoring a Hy-Gain (newer version of the Galaxy GT-550) GT-550A and the reduction drive has recently developed backlash. In these rigs, 2 drives are used. The one on the face of the front panel is a Jackson drive. Galaxy used a 2nd Jackson drive inside. Hy-Gain has used what appears to be a little more sophisticated drive that has 4 spring loaded adjustment screws that would appear to allow changing the pressure on the ball bearings. Unfortunately, it will mean a lot of disassembly to get to it.
I have lubricated the drives and bearings with a medium weight oil, but perhaps this was not the right thing to do? The backlash showed up before lubrication.

Does anyone have any thoughts on these drives. The exterior drive is not slipping BTW.

Tnx,
Dale W4OP

There are a few 6V vibrators for sale on QTH.COM, look
in the tubes, etc. That's a early cold war spy set, is that
correct? Outstanding performer on receive and transmit,
it will literally load into the proverbial wet noodle.
I have a complete set, but never did try to find the vibrator
for the empty socket.

I got a couple of the subject tubes which are supposed to be "glow modulator tubes". Best I can determine is that the light output will vary with current but I can't find data sheet googling. If anyone has pinout and/or data I'd sure like to see it. I think it might be a mid 1960s item as my 1957 Sylvania manual doesn't show it.
thanks

Does anyone have a Drake SL-1800 narrow SSB filter for the TR-7/R-7 that
they want to sell?

Please respond with price shipped to NJ (zip code 08638)

Tnx & 73   K2ZE

Google is your friend. See:
http://www.radiomuseum.org/tubes/tube_r1131c.html for a little information. Unfortunately they require a membership fee to download the datasheet illustrated.

Evidently these tubes were orginally used for early facsimile machines (the sort used to send newspaper wire photos) but the search shows it was also used extensively in vision research.

Perhaps someone knows of a better source for the datasheet.

I have a Sylania Technical Manual of tube data sheets dated 1959 and
have the blue add-ons to 1960, and that tube is not listed anywhere in it.
Sorry.

Jim, its not a cold war spy set, it's just a British military receiver that

uses directly heated tubes (ARP12's and AR8's) .
Thanks for the info on the vibrator.

Sounds like what we used to call "crater" (sp?) tubes and were used in
NOAA weather satellite optical printers for APT data in the 80's.
Muirhead (UK) was the mfgr. of the receiver/printer units. I simply
don't recall who mfg the tubes, though. They were octal based, however.

Yes, it's definitely a crater tube. I don't have a data sheet on that
one, but I have the phototube volume of the RCA HB-3 which has some other
more or less similar crater tubes listed. The data sheet has a chart of
light output vs. current and it's not very linear, but it tries to be.

They were used in some early computer plotters and in a bunch of chart
recorders as well.

It's also got a very interesting mounting collar on it. Is that part of the tube
socket, or completely separate from it?

Does anyone have at least the power supply portion of the schematic they can send a jpeg, pdf or provide a link? The one on the BAMA site is in deja-vu format. I have been unsuccessful in finding a usable reader.

Thanks!

Check at:
http://windjview.sourceforge.net/
for readers for Windows and Macintosh.
A lot of the DJVU documents at BAMA are too compressed
to be readable but its worth trying. Use the mirror site for
downloads.

I can help you with a "PDF" compilation of a "JPEG" manual I found on
the net. Size about 3 Meg. Just come up with an mail-adress.

Thanks from me also.  My other DJVU app quit when I updated my Mac System
from 10.4 to 10.5, so I've been without a Mac viewer until right now.  It
boots very fast and works well.

Don

Snipping...

Good, some of the manuals on the BAMA site are pretty low res, still very valuable. I think the site owner stopped supporting DJVU format because the reader was not doing a good job. I think its worth downloading the viewer just to have the capability on your machine.

Good luck with your equipment, Drake made good stuff.

Craters & Freighters:

http://www.cratersandfreighters.com/cf/home.do

I have used them to ship very heavy and expensive radios & TVs & radio/TV combos across the continent. Door to door service.

Yah, they charge more than UPS, but it's cheaper than receiving a box full of broken junk.

Just because it's in a metal cabinet doesn't mean that it can't be destroyed if some pinhead tosses a thin, poorly-packed cardboard box off a loading dock and misses his target. I speak from experience :-(

Russ

The djvu format has a number of advantages over pdf. File sizes are usually much smaller, you can edit, add or extract individual pages from the files with the free (obsolete) Solo 3.1 software and pdfs can be converted using one of the free online services, which can also index files created from jpg formats using OCR compiled from graphic scans of manuals.

It might be worth trying a different viewer(s). Simon suggests DjVu Solo
3.1, which is what I use. You can also create DJVU files with it. You
can get it from
http://www.tuberadio.it/utils.htm
```

```
Impress (and annoy) your friends by sending them DJVU files instead of
JPGs and PDFs!

This site also has also has a lot of other interesting stuff.

Hi Robert,

I have some PDF's of scanned tube manuals(Eimac, Taylor RCA), I would love to trade a few for a pdf of the Sylvania Manuals.
If interested email me.

Cheers

There is a Sylvania tube manual on-line at:
http://www.pmillett.com/sylvania_tube_manuals_online.htm

However, it does not cover the R1131C

Lots of other good stuff on this site including several RCA tube manuals and many books. All in PDF form but _very_ large files.

If it's a Cubic Astro 102BXA, etc.
There's some background material here:

http://www.eham.net/reviews/detail/798

One reviewer, who liked the set said:

"..Treat them to a decent-quality mic of
the high-impedance variety; a Shure 450
or equivalent works just fine with this
rig."

hi guys,

i'm in the process of restoring a 180a. tubes are good, i changed the electrolytics. rcvr does need a bit of hf alignment but works well now except for the last problem. so here it is...all functions work well on the lower bands. when the 2 highest bands are selected, triple conv. kicks in, am reception works well, but ssb & cw does not. the ssb audio & the cw notes have a raspy or burbelly(for want of a better word) sound. i can't understand why, because ssb & cw work fine on lower bands. i have the bama prints, & poked around checking resistance & voltages. can't find any far off. any help would be greatly appreciated. it's a nice vy clean rig with clock & noise blanker, i have matching spkr also. i want to set up an swl pos.

tnx pete k2iqk

Does anyone make those nice octal relay cases anymore? I poked around
web for the last hour and didn't find any. Magnecraft, Potter-Brumfield,
etc. use to have them. I can find lots of relay sockets, but none of the
empty relay cases. It cheap enough to buy a relay and pull the innards out,
but that seems kind of wasteful.

Thanks,

Steve.

I think NTE has some plastic ones. Sescom will sell you some beautiful
metal ones.

WECO, who have the old Amphenol facility, might make some too.

I think you'll find that the conversion oscillator for the upper bands
is the problem.  I had to work mine over (read: component re-build), to
include replacing the "good" tube and cleaning the socket.  It was a
shotgun re-build but it did cure the problem(s) in the end.  The
instability I had was genuinely a pain-in-the-%$#!

This is a crystal controlled oscillator operating at
around 2580Khz, you should be able to pick it up with
another receiver to see if its unstable. Keep in mind that
the crystal itself can go bad.

I'm a VERY new Ham, so please bear with me. The instructions for the Kenwood TS-820 say to tune the radio for a dip in the meter, as partially described from the manual below.

PLATE TUNING
Turn the METER switch back to IP, leave the MODE switch at TUN and flip the stand-by switch to SEND Quickly adjust the PLATE control to dip the plate current (a minimum meter reading) Return the stand-by switch to REC
NOTE: The TUNE position permits tuning of the final tank circuit at reduced power without danger to the tubes. With the MODE switch to the TUNE position, the screen voltage of the finals is reduced to approximately 50% and the keying circuit is shorted.

The problem is, that once I have completed all of the previous (not listed) steps, and finally try to adjust the Plate control for a dip in the meter, the meter completely pegs to the left when I flip the stand-by switch to SEND. I have installed new final tubes, and can still tune the rig so the power shows to be putting out 100 watts. I can make contacts with this rig, but I'm worried about not being able to properly dip the plate current.
Has anyone else had this problem, or can anyone point me to the "cure"?
Thanks in advance!

Start with the loading control fully counter clockwise, or read the
directions
regarding the initial setting for the loading control.

Did you mean to say the meter pegs to the RIGHT???
If so, then the comment about the load control you received is the answer.
If it really pegs to the left....then you got other issues!!!
....Dave

ISTR an instance where the LO tube was squirrely and the distortion
wasn't noticeable until you hit the higher bands. Worth a try to sub it
with a known good one.

You need even ask? Art Collins is rolling over in his grave.

   OR if "not"...has anyone had this
> experience and can offer any advise as to
> a possiable solution.

Motorboating is a low frequency oscillation that is caused by varying
current draw in the audio output stage causing the power supply voltage
to rise and fall and get fed back into the input stages. You have a
bad coupling capacitor, or a bad electrolytic in the power supply.

Check C106A and C.

It is very much not normal. You have a filter cap somewhere in the audio
section, most likely somewhere in the power amplifier section. While you
are in there, I believe there are some cathode bypass caps that ought to
be changed out too.

>Can anyone advise if this is "normal"? OR if "not"...has anyone had this
>experience and can offer any advise as to
>a possiable solution.

Motorboating is a low-frequency oscillation usually caused by the power
supply not being stiff enough; a high level signal pulls the B+ down,

which reduces the gain which reduces the load so the B+ goes back up again... and on and on.

I have inherited some vintage radio pieces from a relative who recently passed away (this sort of thing is always bittersweet -- I lust after those radios, but I'd much rather have my uncle-in-law back, thank you very much!).

I'm in Oregon. the radios are in North Carolina, and I'm not sure that there's an experienced antique-radio-shipper at that end that I can call upon to pack thing up properly. There's around ten boxes, one of which is reported to be 100 lbs (it's a Collins 75-A -- is that really 100 lbs?)

What can the group suggest for having this stuff shipped? Will UPS or Fed-Ex handle such a heavy radio? My uncle's ham club is helping the family liquidate the radios, but the fellow that I talked to was uncomfortable with the idea of opening up the rig to pull tubes for shipping. Is there a way that I can get this done, or do I need to impose on my father-in-law to do it (they'll be out for the internment).

Suggestions are welcome.

Thanks.

A naked 75A4 weighed about 35 pounds.

More like 35 lbs.
>
> What can the group suggest for having this stuff shipped?  Will UPS or

UPS will ship up to 140 lbs.  My wife just got a 121 lb rug delivered
by UPS.

   My uncle's ham club is helping the

There is no need to pull tubes. If you are really worried, take a few
plastic bags loosely full of peanuts and fill the inside of the radio
with them.

Some big radios, particularly transmitters were shipped with the transformers
removed because the chassis could not handle the strain of a big lunk of
steel and copper being tossed around.

The biggest suggestion I can offer is to double box everything. The first
box should be a pretty close fit to the radio, with some foam padding where
it seems appropriate. The second box should be at least 4 inches bigger in
all dimensions, and be packed firmly with peanuts.

Ensure that all of the chassis to cabinet screws are in place! Many heavy
sets
had screws on the front, bottom and along the rear apron.
An improperly secured chassis can wreck havoc during shipment.

Pete

If one looks at how the manufacturers originally did it, much is revealed. For example, EFJ often crated things like the Valiant and 500 and, as other have noted, transformers were often not installed. The best way to do it these days is to use a foam-in-place packaging method with a minimum of a 3" plenum of foam. Double boxing and the use of double and triple-wall type containers will also help with external penetrations. Boxes should be either steel or fiber-reinforced tape strapped. Finally, select a good shipper. I would not personally use UPS. They do a creditable job with their commercial customers but have utter disdain for the Harry Homeowner shipper. Yes, there are a few conscientious employees at all the available shippers but its the end-to-end result that is the issue. Finally, if you do in fact have a sizable shipping consignment, you might even consider a national-level, over-the-road trucking company to do the job and use terminal-to-terminal service. That way, your gear is minimally handled.
I guess it all depends on how much the gear is worth (to you) and how much expense you chose to incur.
Sounds like to have a real treasure-trove, there!!

Professional freight company, preferably as a single shipment on a pallet.
(They're less likely to drop it off a forklift.) Insure it against damage
in transit (they will then take more care to avoid an insurance claim).

> Will UPS or Fed-Ex handle such a heavy radio?

Do _NOT_ use UPS if you want something to arrive intact.[1]

> My uncle's ham club is helping the
>family liquidate the radios, but the fellow that I talked to was
>uncomfortable with the idea of opening up the rig to pull tubes for
>shipping. Is there a way that I can get this done, or do I need to

A crate with *thick* foam padding or polystyrene chips (Do NOT use solid
polystyrene sheet/board/block, as it has no cushioning value), and about
2 to 4 inches of padding around the sides. Avoid shipping equipment with
die cast (Mazak) components in subzero temperatures as the alloy becomes
very brittle and will shatter like glass if dropped.

Assume the worst: that the shipping company only employs psychopaths who
get a bonus for every parcel they destroy in transit, and package stuff
accordingly. You might get lucky and have it survive[3].

Good luck,

Chris.
p.s: The tagline at the bottom of this post is a direct quote from a
     Signal Training pamphlet: "Maintenance of signal equipment in the
     field" with a small addition by me. Believe it.
[1] Their "sorting" facility uses rams to shove packages off one conveyor
    onto a lower one. Apparently the drop is about three feet.[2]
[2] I've got the result of a near mint WS19 sent via UPS - every panel bent.
[3] Cynical? Me? Of course I am, I have to deal with Parcelforce[4] in the UK.
[4] "The package destruction arm of Royal Mail PLC." -- Peter Corlett.
--
 "...It should be remembered that goods in transit receive very rough
  handling, a free drop onto concrete from a height of 4' 6" is not

```
  improbable, and packaging should as far as possible be made to meet
  these conditions".   --   The British Army has obviously used UPS.

Jim...I have a 511S.
I did a review on eham on it a long time ago.
It is kind-of a sleeper.
As you know, it is not a version of the 520...it is an all tube rig, with
good frequency readout, CW filter, and nice sounding audio.
....Dave

```

I'd suggest having a crate made for it no matter how its shipped.
I had that done a couple of years ago, and it was quite reasonable.
The crate was custom built, and lined with hard styrofoam.
Expect ANY shipper to drop it from 5-10'. Unfortuantly thats
the way things are treated. I have shipped heavy, bulky items via
Greyhound before with no problems.

Steve

REMINDER - ITEMS WILL NOT BE SHIPPING IN THIS ROUND OF SALE

Hello All,

For multitude of reasons (going back to school, recent life changes), I would like to sell off my old radio collection. I would like to start by offering, at low prices, items in my collection to anybody who can just come and pick it up at my QTH (Lexington, MA - good in callbook). There is alot of stuff, here are some highlights:

Prices are all O.B.O.

$150	Hallicrafters SX-28, complete, with S-meter
$100	2 National RAS recievers (1 parts unit) with all tuning coil racks, 1 Lamda regulated P.S.
$100	1 Hammarlund SP-200 (working) with a homebrew P.S. (formerly W1DAN's)
$75	1 Hammarlund SP-200 with repainted front panel and original P.S. (some mods)
$25	1 unknown mfg Coast Guard MF receiver
$75	Heathkit DX-60B and HG-10B set, very clean
$10	Military LM-7 calibrator
$15	Hallicrafters S-40
$30	Military FRR-21 VLF receiver - best you will ever find
$30	Hallicrafters R-44 speaker
$25	Medium Power Balanced Feedline Tuner

Available in two weeks will be the complete BC-610E with complete spare set of NOS 100TH and 250TH tubes, coils, most TUs, and a spare RF deck, AND speech unit w/ parts unit for it. $400

I also have an mass of parts - transformers, capacitors (variable and oil-filled), meters, etc. "Iron" and caps goes for $0.10 - $0.50 a unit (do have some BC-610 iron). Selling all small items by the box - $5 per whatever can be stuffed into a Staples 9" x 12" x 4" shipping box (some boxes available to take items in).

Old handbooks, manuals available. Reel-to-reel tape collection too.

My garage and basement will be open on Saturday (starting 3/15), from 8 AM - Noon, for the next four weeks, may continue depending on remaining stock of items. Will update posting. All others times must be scheduled in advance; late arrivals must telephone before noontime.

In God I trust, all others pay cash. Receipts will be written.

AGAIN, NO SHIPPING FOR ANY OF THE ITEMS LISTED AT THIS TIME.

Thanks all. Let my life-change be your benefit. Spread the word.

David Goncalves

I learned this past week that Tim Buehlmann W4TIM,ex N4IQA of Raleigh NC
passed away last month.
Two of his friends are helping the family dispose of Tim's amazing
collection of rare early radio gear.
They are bringing the collection to the Charlotte Antique Radio
Conference to sell.
Some of the lesser items will be offered in the flea market
on Friday morning. the rarer high end item will be consigned to the
auction that will take place Friday afternoon.
There are a number of pieces of early amateur radio equipment, spark
transmitters, tube transmitters, early receivers and a bunch of early
rare tubes. I understand that there are a number of spherical audions, 2
"P" Pilotrons, plus a lot of other collectible tubes.

I have been told to expect an inventory list and photos of the collection
that I will put on the clubs web.

As soon as more is known I will post the updates.

This may be a once in a life time chance to buy some truly rare
collectibles.
If you haven't made plans yet to attend the Conference, you might want
to do so.

The Sheraton still has rooms available at the Conference rate of $83 a
night.

Pre-registration forms and a Conference brochure are there for you on
the conference web page. http://cc_awa.homestead.com/Charlotte.html

If you have any questions, let me know.
The show is just 10 days away. You need to get your per-registrations
in ASAP. The pre-registration has been extended to allow for late
registrations
due to lateness of this news.

See ya soon,

Ron Lawrence W4RON
CC-AWA President & Conference Chairman

Hi Dave:

I have a couple Pacemakers. They only came one way, although there may have
been changes during production. It was not long lived, because it was a
stupid design. When Johnson saw how the competition made their ssb rigs,

they stopped production. Everytime you change bands, you need to null the carrier.

73, Clin K7FM

for folks who are interested in attending, but unfamiliar, the web site
says nothing about where this is, except at some Sheridan near
Charlotte> It would sure help to get better details/directions on the
web site. Can you help me pin it down? I might fly down (small plane) so
need to locate nearby airport. Thanks

Should be less than forty pounds. Figure maybe 65 pounds total if you build a wooden crate for it (which I recommend).

>What can the group suggest for having this stuff shipped? Will UPS or
>Fed-Ex handle such a heavy radio? My uncle's ham club is helping the

Fed Ex Ground is the cheapest method, and if you get a free FedEx account you get a 10% discount on that. They will handle up to 120 lbs. and at that point you start looking at freight forwarders (which includes FedEx's freight operation). Standard counter rates are on the website.

You don't need to pull tubes, but it wouldn't hurt to stuff the cabinet with packing peanuts to keep them in place.

Equipment with really heavy power or modulation transformers or with big electric motors may require the motor or transformer to be removed before shipping to prevent damage. This includes old Ampex tape machines and any broadcast transmitters. It does not include stuff like the 75A.

I kind of miss my old 75A... it was a fun receiver. I replaced it with a 390A a couple decades ago and even so I still miss it.

Simply search 'competed auctions' using the same make/model. If he
picked it up in the last 90 days, you'll find it, how much he paid, and
what lies he's telling ('shack clean up' etc) about it.

> web site. Can you help me pin it down? I might fly down (small plane) so
> need to locate nearby airport. Thanks

The conference is at the Sheraton Charlotte Airport
Hotel, located on I-85 at exit 33, The Billy Graham Parkway,
in Charlotte NC.

Hence the name, it just a few miles from the Charlotte?Douglas
International Airport.

Here's a link to a Google map of the hotel location.
http://tinyurl.com/2jrm4d

I hope that helps.

Ron

What about a furniture/house removal organisation who will pack it into
a van and cart it from door to door without transhipment so no special
packing needed. Maybe the cost and distance from one side of the US to
the other would make it too expensive compared with the value? Maybe
hire a van, take some time off and do it yourself?

Simon

Here is the HB-3 entry:

http://www.pmillett.com/tubedata/HB-3/Receiving_Tubes_Part_2/6KD6.PDF

It's another one of those damn TV sweep tubes, which folks have pressed
into RF service.  They are nearly unobtainable because the bootleg CB
guys have blown so many of them up.

There is no drop-in replacement, although I have seen equipment designed
for use with sweep tubes modified to take 6146s.  The Svetlana EL-509
is probably as close as it comes and it will take some modification to
make those work in most circuits.

Hello,
I'm repairing the SX-146 receiver. First problem was the transformer
rewound for 220V primary that has been changed to an autotransformer,
with the obvious problems. Now I'm rewinding it as a transformer again
maintaining the 220V primary. Can anyone tell me what's the secondary
HT voltage supposed to be?
Counting the turns it appears to be 170V, but if someone can measure
it I'd appreciate it.

Then I'll have to reconnect a good amount of broken wires, but this
should be easy with the aid of the schematic.

Also the unit lacks all optional xtals and filters, any chance I can
find these xtals and filters anywhere nowadays?
Thank you and best 73 de

IZ8DWF Francesco

I now have 3 pages of photos of some of the estate items.
http://cc_awa.homestead.com/Buehlmann_estate_photos.html
When was the last time you saw a DeForest 15 Interpanel set
in an auction, several early rare DeForest Audions...?

This could be the auction of the decade.

Call your banks, take out a second/third mortage..
bring lots of money.

The show is NINE days away.

Does anyone know the input voltages/taps and output voltages/taps on
the Hypersil transformer used in a 3-holer Alpha 76PA Amp?

W ould you also know the DC plate voltages, and if there was a
SSB/CW tap on the primary like on the SB-220? I'm not familiar
with this amp and need to know the transformer specs.

Thanks,

WA5DXP

Which is really too bad, because they made super pass tubes in regulated
supplies and good HiFi outputs when trioded. Not to mention insane power
in PP pentode as a geetah head :-)

Cheers,

When I was a kid, everybody was converting military and commercial surplus
radios over to use sweep tubes instead of expensive transmitting tubes.

These days, everyone is converting ham rigs intended for sweep tubes over
to use transmitting tubes, because sweep tubes are so expensive.

The 6MH6 has an equivalent base pinout, so it should be usable, although they are not common.

You can build an adapter to change the pinout to a more conventional tube for testing. Tube testers can be tricked quite easily.

If the tube is being used in a transmitter, it is not that difficult to change to a different type of final tube - including the 6146. If it is used in a grounded grid amp, the grids are all tied together, so you should be able to find a substitute and change a few pins on the amp.

Hams are supposed to be good at improvising.

From what I have been able to find the Hypersil transformer was a replacement item from Peter Dahl and it output 1950 VAC and I think it had another tap for CW/RTTY (sqr 2 tap). Don't kno what the original transformer had. I saw one of the hypersils for sale and wanted to know if it would work with my planned amp.

Looking for a 6V 4-pin vibrator and vibrator transformer for the Reception
Set R109.
Would appreciate any help or assistance to locate these items.

Theo

I suggest trying one of the solid-state replacement vibrators.

As far as the vibrator transformer goes.... that will be more of an adventure.

There is some updated information about what items will
be included in the auction on Friday and what items are slated
to be sold in the flea market.
Please visit this web page for the updated information.

You might check with RTO Electronics. I have dealt with them in the past
for Heathkit transceiver repairs. Their website is located at this URL
http://www.rtoham.com/
There are also several other repair folks out there for Heathkit gear.

But then you can make one with about 10 minutes of effort using a drill
press or a lathe.

This isn't the pair of parts you're looking for:

http://www.vmarsmanuals.co.uk/newsletter_articles/vibrator.pdf

but you might find it useful.

Also, Google for "solid-state vibrator"

Antique Automotive Radio makes the things.  Antique Electronics Supply
in Arizona stocks a bunch of them, but there are a lot of the weirder
ones that they don't stock.  They do have the generic 6V 4-pin for both
positive and negative ground.

Probably wouldnt matter if it was on your tester or if there were 'Subs'.

Its a sweep tube pressed into RF service. If its used then consider it
'bad' for such service. May work okay in a teevee set.

Do you have the existing vibrator transformer?
It should be possible to rewind it if it's just an open circuit winding.

The vibrator is the same as used in the Wavemeter Class 'D'
Vibrator No.2 (ZA.27013 or Z730003), and the commercial
equivalents are Oak Type 6 or Mallory 650.

The vibrator transformer output is rated 160V at 10mA.

(This is all according to Wireless for the Warrior Volume 3.)

It occurs to me that the same transformer /might/ be used in other
equipment (I'm thinking Supply Unit Rectifier No.7 here: 12V to 80-0-80
and a few other things, used to run teleprinters and carrier telephony
repeaters/ringers). I shall have to investigate this....

The Class 'D' Wavemeter transformer is probably much too small, but I'll
check that as well. (The only problem is that a lot of those units were
badly "hammed" and converted to AC mains operation by ripping out the
vibrator and its associated transformer, si finding a suitable donor
would be (a) difficult, and (b) a waste of a good Class 'D'.)

Chris.

Hi Chris,
The R109 I have has a grossly modified power supply. The vibrator and
transformer have been ripped out and two 240v mains transformers fitted, one
delivering 6v and the other providing HT.
Fortunately the original HT rectifier is still there.
I have removed all the non-original power supply components. I have managed
to obtain a 4-pin vibrator socket.
I have an unused vibrator transformer for a Wavemeter Class D, it is marked
with a 6-0-6 volt primary and a 0 -140v secondary.
I wonder if this will work in the R109?

```

If one isn't using rattle-cans, NAPA has an aerosol paint sprayer made by Preval in their Balkamp line (pn BK 7705030). It holds 16oz of paint. The recharge kit is pn BK 7705031. I used it to apply negative etch-resist (fancy photosensitive enamel paint) to blank PC boards, and the results were excellent. It's been a long time since I used that setup but, at that time, it wasn't expensive. Applying the paint to surfaces that are first "scuffed" w/ steel wool (or Scotchbrite) & then degreased goes a long way toward the finished product's appearance. Slightly warming the part allows you to spend less time between coats.

73,
Bryan WA7PRC

Hello Friends,

Check this website www.calculatoredge.com you will find several RF Calculator Tool, you donot need to learn the formula to solve the equations, if you have inputs then you can just enter into and get the equations solved.

You also get free magazine subscription on this website, I guess it is useful

Tom

Does anyone know if this was offered without the final compartment shielding? I have two vintage manuals, one shows one with the shield, one without, surrounding the 6146 tube.
Thanks,
Dave Fleming

Dear afcsman,

I have that same model keyer by K.E.Electronics, MEMO 4096. Someone sent me the information on this keyer some time ago and for the life of me, I can't put my hands on it at the moment. When I find the information, I'll be happy to e-mail you a copy of it. In the mean time, I'm still looking on the internet for answers.

Best Regards and 73s,
Gwen, KB6NDC

The 2008 Charlotte Antique Radio Conference will take place March 20-21-22 at the Sheraton Charlotte Airport Hotel in Charlotte NC. Located on I-85 at exit 33, The Billy Graham Parkway.

This event is hosted by the Carolinas Chapter of the Antique Wireless Association (AWA).

This 3 day event starts on Thursday with our Kickoff Luncheon followed in the afternoon and evening with historical programs and forums.

Friday morning at 8AM is the now famous Le Mans Start of our antique radio flea market.
Friday afternoon we'll hold our Old Equipment Auction followed Friday evening with our Annual Banquet.

The Flea Market starts off again on Saturday morning along with our Vintage Amateur Radio Forum. Saturday morning is wrapped up with our Radio Rescue End of meet Auction.

The Conference ends up with our Saturday Luncheon at 1pm.
We also have large Old Equipment Contest with the final judging on Saturday morning.

Pre-registration admission for the Conference is $15 for all three days, $20 at the door.
Vendor Space Rental is $30 for the first space, $20 for each additional space.

Saturday Only admission is FREE.

You can find complete details, including a Conference Brochure in .pdf format and a printable pre-registration form on our Conference web page at, http://cc_awa.homestead.com/Charlotte.html

The Sheraton has given us a special conference room rate of $83.
This rate is available until the start of the event.

Deadline for mailing pre-registrations is March 11th.

Hope to see ya there.

73, Ron Lawrence W4RON
CC-AWA President and Conference Chairman

Is anyone in the group going to the Charlotte Ham Fest next weekend?
If so be sure to stop by the CC-AWA booth next to the wall on the left
as you come into the flea market area.
Look for the Antique Radio meet banner and the early radios
sitting on the table.

We'll be talking about radio collecting and the upcoming Charlotte
Antique Radio Show.

Hope to see ya there.

```

Is there some reason this guy has to make up lies about what he sells?

Here he purchases a Drake 2B receiver and matching 2BQ Q-multiplier.

http://cgi.ebay.com/Drake-2-B-Communications-Receiver-WITH-2-BQ_W0QQitemZ260209542986QQihZ016QQcategoryZ4673QQssPageNameZWDVWQQrdZ1QQcmdZViewItem

Then he lists them separately saying he did a "huge shack clearance",
like he has had these items for some time.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=4673&item=270214177393

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=4673&item=270214177395

Here is the story he tells about the 2BQ.

"Well I discovered this very nice conditioned, Drake 2BQ in a box in a
closet when I was doing a radio collectors shack clearance,"

Is this guy a ham? If so, anyone know his callsign?

I wouldn't worry about him. He only made $20 or $30 before commission
payments for these sales and some people got some good equipment.

Google Radio-Mart. He's a well known shyster.

73, Roger

I understand the under new ebay rules, sellers can no longer leave
negative feedback for buyers. Now maybe buyers who get cheated by this
guy will be more willing to leave him a negative.

1.Put a hat at the foot of your bed.
2.Get in bed.
3.Drink enough of your favorite beverage (Southern Comfort, for example) until you see TWO hats.
4.Relax, sleep if you want.

It ain't worth the bother. There are always sharks in the water, and eventually they end up as the Shark Liver Oil in Preparation H. Judeo-Christians call it "Measure for

Measure;" others call it "Karma."

Did you ever send in a cereal boxtop and buy the cardboard periscope that Cdr. Corey used to get through the maze that protected the crystal slave drivers?

FS Beautiful Nye Viking MB-V-A 3kW tuner. Orignal black paint on cabinet is perfect as is the front panel. Has the desirable raised emblem. Quality throughout. The rugged Nye Viking MB-V-A 3 KW HF antenna tuner features a heavy-duty silver-plated variable inductor with a 25:1 vernier dial, 7,000 volt variable capacitor and 15,000 volt switch selected capacitors. The frequency range is 1.8 to 30 MHz continuously. Dual-metering provides for hands free SWR monitoring. The backlit dual meters show SWR and power continuously. Push button antenna switching to 4 antennas (2 coax, single wire and twin lead). There is a tuner bypass position for the coax antenna input. The 3kW balun is trifilar-wound, triple core torroid with balanced output to twin feeders from 200 to 1000 ohms unbalanced output down to 20 ohms. Outputs are provided for two coaxial cables, one single wire and one balanced line. The extra heavy gauge aluminum cabinet provides effective shielding. 14.7x6.7x12.25 (WHD) inches. 18 lbs net. MINT condition with orignal manual and shipping carton. $425 SHIPPED in CONUS. Digital pictures available. Thanks, Charlie Hugg, K5MBX

Sounds to me like YOU have been seeing too many hats! Maybe
a little less Southern Comfort at bedtime for you.

I did send off and get the cardboard cuts of the space city complete
with the Commander's space ship that would soar down into the city via
a string onto the space pad.

Hello,

I've got these two units, they need a good amount of servicing I
think. Since these are the first all-tube sets I own, I wanted to ask
about info that might not be present on the manuals (I have both
manuals too).
What kind of microphone is suitable for the ht-46? I read high
impedance but isn't clear to me where to obtain one.

Thanks in advance

Francesco IZ8DWF

I am looking for a 110V AC power supply for a Hallicrafters SR-160 in good working condition. I have a mobile supply (in case you are interested in a trade) however I am willing to purchase outright also. Thanks, Mark

Hi All;
I've been saving this for years but now realize that I'll never get to build a small CW Xmtr so its time to move it to someone who can put it to good use.
Stancor(Chicago Transformer Co.), Model PC8411, 4 hole, above the chassis mount, enclosed.
All wires are uncut & original length, some surface rust on the laminations, Bells are fine as is the yellow label.
Primary Voltage = 117V. 60 Cy.
Secondaries= 375-0-375 @ 150ma dc
Filiment= 5.0v @ 3A.
Filiment= 6.3v @ 4.5A
Weight shipped about 8.5lbs

Price is $75 + $9.00 for Priority mailing + insurance if wanted.
Will make a nice transmitter supply.
Tnx & 73.......
Rich WA2RQY/4

Nope! At that time I was absorbing the wisdom and ethics
that I found printed on the "Straight Arrow" (Secret
Comanche) cardboard strips that separated layers of Nabisco
Shredded Wheat!  And I still take pains to maintain 100%
Favorable Feedback on all my eBay sales.

I have an HT-46 / SX-146 line since 1965. It was my very first SSB rig. It still use it from time to time, just to relive the good old days emotions.

Any piezoelectric microphone would do. Or a dynamic microphone with a high-impedance output, e.g. the Shure 444.

Most modern microphones (Kenwood, Icom, Yaesu, etc.) instead only have a low-impedance output and do not then produce enough voltage for the HT-46. However they may be adapted using a low-to-high impedance audio transformer.

Anther solution would be to use a pre-amplified microphone (Shure, Turner) that would certainly produce enough voltage for the hungry HT-46 mouth.

That's not him. Radio Mart is Martyn Allison. He lives in Sadieville, KY.
I've read that he claims the UK call sign of G4AGV. It's not listed as a
valid call that I can find. They probably ran him out of Britain and striped
him of it.

Striped him, did they? What color is the stripe?

Guys, the safest course of action is simply not to bid on any of his offerings. The guy is obviously devoid of ethics. It is also obvious that Ebay has no plans to do anything about him.

Amateur Radio License Exam Preparation Software
Getting your Amateur Radio License has never been easier. Effective February 23, 2007 the FCC removed the Morse Code requirements for all Amateur Radio License Classes . Since that date, applicants for a Technician, General or

Extra Class Amateur Radio License no longer have to demonstrate proficiency in Morse Code. You just have to pass the applicable written examination.

That's where we come in. Our amateur radio license exam preparation software serves as a training aid to help amateurs and prospective amateurs pass the Volunteer Examiner Coordinator's (VEC's) administered exam. When you can consistently pass the exams given by our exam preparation software, you will almost certainly pass an actual Volunteer Examiner Coordinator's (VEC's) administered exam.

Our amateur radio license exam preparation software uses the latest officially released Volunteer Examiner Coordinator's (VEC's) approved question pools. The program breaks the test into different sub-element. Integrated into the software are illustrations and Part 97 rules pertaining to the current question. The program tracks the progress of the tests taken. Once you have mastered each sub-element you are ready for the officially administered exam.

Wait a little while and the FCC will grant us a single block license as they did in the Seventies for CB licensees. Then you can make up your own callsign and have at it. This is how dimly we are viewed by the powers-that-be.

Is there an easy way to calibrate the dials on my Hammarlund
HQ-100AC?  I am about 200 KHz off.  On the 1.6-4 MHz band, my HQ-100
tops out at about 3.8 MHz with both dials fully clockwise.

Is the dial reading off the same mechanical amount on all bands?  If
that's the case, the setscrews in the dial(s) can be loosened and the
dial(s) re-positioned.  If its a case of electrical alignment, e.g.: the
dial is off calibration but not the same direction or magnitude on all
```

bands. If its a mechanical issue, you may have to remove the front
panel* to gain access to the set screws. I don't recall if the
HQ-100/110 allow access with simple removal of the case. I am curious,
however, as to how the receiver got that far off unless a previous owner
got a new set of GC alignment tools for their birthday.? Things do
happen... though. If you'll pass the add'l info, I'm sure we can assist
with an appropriate procedure. Regards de K3HVG

* Also be glad to pass on some hints on front panel removal on
Hammarlund gear.

Hi, acquired a ts-511s with power supply and cant find much info.
all cleaned up and working with one minor bug to fix.
not a keeper for me, just curious that I havent run across any for sale
on the auction sites or info when googling, so dont know how to price it
if and when i fix the remaining problem. ie: on 75 meters only after 20
minutes
75 loses xmt and receive functions, all others work fine , full output etc.
tnx Jim kw3u

For distinctive looks, you can't beat the Astatic D-104. It
was probably the most-used microphone of those times, and
there are enough of them around so the price has not
inflated beyond reason.

Check out eHam.net boatanchor forum. I gather that this is
an early version of the TS-520, a hybrid using final
amplifier sweep tubes to generate 500 pep. If it's got the
same guts as a 520, it should be a hot one for receive

sensitivity/selectivity/stability. omeone compared it to a
TR-4CW... One sold in 2006 on eHam.net classifieds for $300,
including PS, extra for shipping.

As a matter of fact I am just using a Silver Eagle microphone (deluxe version of
the D-104) in conjunction with my HT-46 / SX-146. However, I did not suggest
that microphone as I tought it is more appropriate for a rig older than the
HT-46 / SX-146, but I may be wrong.

The D104 had a really long run, though I suspect somewhere along the
way its casing was all that connected it with the microphone of
decades before. You could still buy them new in the CB era thirty
years ago, and for some reason they did seem popular there.

Someone who had one wasn't likely to dump it when they got a new rig.
Hence even if Astatic had stopped making them decades ago, there likely
were people who used those Hallicrafter rigs with D104's back then.

Hello All,

There is an Eimac SK-300A socket for the
4CX5000A/10000A/15000A available on eBay right now.
In case anyone is interested, it is item # 140212404793

http://cgi.ebay.com/ws/eBayISAPI.dll?
ViewItem&rd=1&item=140212404793&ssPageName=STRK:MESE:IT&ih=004

Thanks.

Nanu

Novice RS-3, July 1963 QST, p 42.

Does anyone have a way to make a copy of the RS-3 Regen
Receiver that was written by Lew McCoy back in '63?

This was my very first homebrew project and I plan on
recreating this. I've searched the internet with no
luck.

Thanks
Jim

Hello Collins KWM-2 users:

I've almost got my KWM-2 working again, but noticed a problem that is

eluding me.
The Radio receives "great" with RF Gain turned up, BUT when the Audio
Gain Control is increased the RX audio
starts to Motoroboat ,   which overrides the incoming audio.
The motoroboating occurs even when the RF gain is turned down and the audio
control is increased.

I suspect this is NOT normal, but have never had a KWM-2 previously.

Can anyone advise if this is "normal"? OR if "not"...has anyone had this
experience and can offer any advise as to
a possiable solution.

Thank You....Norm VE3CZI

First of all heater to cathode leakage may cause hum modulation which is dependant on the AVC bias voltage so it should not be discounted.

While leakage of capacitors is often called equivalent series resistance (ESR) it can also be parallel resistance. For instance its pretty common for bad electrolytic caps to look like dead shorts. The same can happen to paper caps. If the parallel resistance of a capacitor is low paralleling another cap across it will simply put the low resistance across both. So, if one is checking for bad caps its best to actually substitute the cap otherwise you can be mislead.

If you don't have a tube checker you can also check by substitution. You can switch the tubes around since the HRO uses the same types in a couple of places. Moving a bad tube should change the symptoms. Since you have another receiver you can do more complete subsitution checking. Check tubes with AVC on them since the varying bias will change the way the tube modulates the signal, assuming its bad.

BTW, have you checked to see if the hum changes when you go to manual RF gain control? There may be a clue there if it does.

Tunable hum is easy: most of the time it is caused by either heater-cathode
leakage on the AGC, or pentodes in the IF amplifier, or bypass capacitors on
the AGC, or IF tubes.

Tunable hum is a modulation issue, the small amount of ripple that comes from
the heater-cathode leakage is amplified greatly by the AGC circuitry, and
AM modulates the IF signal with power-line hum.

A little tube swapping very often finds the problem. Start with the AGC/detector
tube, and then go to the tubes that are controlled by the AGC line.

Make sure that you put any tube that isn't bad back in its original position.

If you look at the power supply, you will probably see a multi section electrolytic
capacitor that has resistors between the sections. Usually, the AGC tube is powered
from the most filtered section of the power supply filter, so if the hum is coming
from there, it is usually everywhere.

Hello,

I've got one Stephens Engineering Associates SEA 112 HF marine transceiver..

Yes, it's a crusty old radio, but I'd like to fix it up. I do repair radios from time to time, but I'm not familiar with this design at all.

1. How are the frequencies programmed in? I see no crystals or diode matrix for programming the channels as I would expect in an older set. I have not taken the sandwich of boards in the center of the radio apart.. the bandswitch seems to go through there and I'm not going to mess with it just yet. So, is this an EPROM-programmed set?

2. Has anyone managed to convert this model for ham radio use or is it best left as is? (I've read at least one case of a mariner throwing one away, so they must not be too valuable.. And the weight qualifies it as a BA) I've got no antenna tuner,
just the set with microphone.

If anyone has the manual including schematic/service data, I might have an interest in it.

Thank you,
Patrick

If you would like to reply directly, please reply to the e-mail address, removing the "REMOVE_THIS".

Hello all,

I have a friend who DESPERATELY needs a manual for the Heathkit SA-5010 CMOS keyer - I cannot find one online. Does ANYONE have this electronically (preferred) or printed, that I could pay a reasonable amount for copy cost?

HELP!!!

Dave WB7AWK

There's several different bad modes of failing/failed mica caps in the IF xfmrs. As related to gain as long as the xfmr shows good peaks during alignment the value should be correct. The thunderstorm noise and intermittent operation usually occur before the thing goes completely open.

Are you getting regeneration? I found I could not achieve regeneration until everything was quite up to par. That seems like a good measure of its overall health so if there are still problems with the meter in the AM mode that might be localized to something more specific than general IF gain.

Try here. I think you have to register with them (no charge) but I
have used the site before and it seems 'safe'.

Tony

You have been offered several suggestions, and I offered some advice
and never heard a reply back to some questions I asked regarding the
antenna system and grounding.

Tuneable hum can indeed be caused by poor cathode RF bypass caps
in the RF and IF stages. The lack of adequate bypass capacitors would
allow any RF/IF stage with cathode/filament leakage to be modulated
by the AC signal on the filament. No signal, no hum.

If you don't find one here, there are several listed on Ebay.

I recently came by a Heathkit Comanche & Cheyenne tx/rx set.
Units are in near new condition except for thr paper roll charts. I
would greatly appreciate any info on replacing the charts

BTW, Heath Educatiohjal Systems still exists in Benton Harbor, Michigan ...
and I have ALWAYS been able to call and get an older Heath kit assembly
manual.
http://www.heathkit.com/support.html

Manual photocopies are available for many old Heathkit products for a
nominal fee. To inquire, please have the exact model number ready and call
1-800-253-0570 or
email: manual at heathkit.com

Thank you to all who have made suggestions. At this point I have gone thru every component and all the wiring in the radio (except the IF's because they peak and I get regeneration and no other symtoms of an IF problem) and it receives well but while the S- meter moves for the signal gen signal on AM reception, it only moves a cm at most on strong received signals. Bringing up the selectivity (regen) to below oscillation, brings on some more realistic readings, but for the most part the meter is still not doing its thing. At this point , I am puzzled esp since it receives so well. Several things I noticed in going thru it. Someone had replaced a 10K 1watt resistor with a 5.6 K which I put back to stock. Also they added an electrolytic that is not on the schematic. I played with it and it is needed to cut some hum. Since this receiver has had other hands in it, I think a high quality bottom view picture of the chassis might help me spot something I missed on the schematic. 73 Mike KF

>> I have to carry more tests on my HRO, including that of connecting my Yagi
>> antenna to it instead of a short indoor piece of wire.

Using my HF Yagi antenna instead of the indoor wire all problems completely disappeared and there is no hum at all on any station. The problem however is not due to interfering sources (e.g. lamps, power supplies, etc.) in my house, but to the fact that the RF signal of certain stations (not all of them) follows a path where it gets modulated by alternating current. As a matter of fact, using a simple wire, the ground counterpoise is represented by the house electrical wiring

> can be mislead.

Still, I am unable to follow your argument. Assume that a screen bypass capacitor is leaky. Its DC resistance typically is in the range of several hundreds kohm (should it be lower, the screen DC voltage would be greatly affected). Having a resistance in parallel to a good capacitor does not impair its bypassing function. Even a low resistance value would not harm (apart from its effect on the DC voltage). In the limit, a zero resistance would turn into a perfect bypass (again, apart from the DC voltage).

> BTW, have you checked to see if the hum changes when you go to manual RF
> gain control? There may be a clue there if it does.

The hum-to-sound ratio was almost independent of the RF gain control setting (a potentiometer of the tubes cathode).

Both of the above statements indicate that the hum was caused by emissions from your receiver, or your shack.

Classically, on a solid state rectified device, the rectifiers don't switch instantly, and hand up for an instant at every zero crossing of the AC waveform. That hang is a 1 usec long short circuit, and emits 60Hz glitches at every crossing.

It will radiate 60 Hz modulated broadband hash over a frequency range that includes the AM broadcast band.

When you switched to an external antenna, you did two things, one, you got the antenna away from the interfering source, and two, you increased the signal strength of the received stations.

Probable sources of such hash are compact fluorescent lamps, regular fluorescent lamps, the power supplies in any test equipment, or soldering irons in your shop, and the radio itself.

-Chuck

I need a 1650 KHZ tube type IF transformer. It is out of a SX-130 receiver but Hallicrafters use this IF frequency on a few other receivers. Will buy a Junker or receiver. Tom K6XD k6xd@cfl.rr.com

Hmm, 1946. This must be one of the first postwar models to use
subminiature tubes.

I'm curious, what is the first consumer radio to use all subminiature
tubes?

Best,

Jeremiah

Try following some of the links at
http://www.hammarlund.info/

I also wanted to suggest Andy Moorer's site but either
its down at the moment or gone. There are links to it from
the above site. Moorer does not take on outside work but
probably knows who does good refinishing.

I think you mean miniature tubes. Sub-miniature tubes were used in a few small battery portables but didn't catch on. They were used extensively in hearing aids, though.

I don't think it is strictly a matter of them not catching on. They became commercially affordable right about the same time as transistors. They didn't stand a chance.

>
> And I think they were used even more extensively in airborne military
> computers.

They also showed up in main frame computers. Somewhere I have some cards that came from some computer that used a staggering number of the wee beasties.

CK6088's were the tube they used.

Tony et al,

I have followed this thread with interest as I had a similar problem
on a Hammarlund SP-200. Pulling tubes I isolated to the first or
second audio or detector. It was only when I measured voltages for
each pin on each tube that I began to see the problem. On the first
audio I measured the grid and found it to be a bit high

They were also used in the AN/ARN-21 TACAN sets in aircraft.

Rich,
    You can do the job yourself.  I have the same model, and redid the front
panel.  As I recall I stripped it, and used emery and steel wool to get an
even
finish.  I then used the nearest match I could find in a metal spray paint
and
coated the entire panel.  The lettering etc is stamped-in on this one, so
very
careful work with a paint pen restored that.  Over all, I clearcoated it.
    It may not be "exactly" correct in color, and may be a little glossier
than
original, but it looks very good.  I wasn't trying for a museum restoration,
though.
 Hope this helps.
    Nelson

I have an old '60's Motorola Dispatcher motorcycle
transceiver that used mostly submin tubes (with fine-wire
leads) in the transmitter--"instant-on" when you
pushed-to-talk...

But I'm afraid that nobody helped on the original Question!
  Somebody believed that the Pilot Radio was
authentic-looking enough to pay $510. for it.

    Some paint places have color analysers that can
determine a mixture to duplicate samples. I've not heard of
anyone using this for radio equipment but the idea occurs to
me. Of course, the paint would not be in spray cans but
brushed paint can be quite uniform and there are small, not
too expensive sprayers.
    I wonder if anyone out there has tried this.

Absolutely! I regularly use an automotive paint supplier here in the MD/DC area (McHenry, specifically). They have MIL and FEDSPEC chip books, all automotive color books, as well as a color densitometer. They can batch in spray cans or in bulk. The only thing they can't (won't?) do are things like wrinkle* or hammertone. So far, they've done a respectable job on most anything I can provide a sample of; e.g.: EFJ, Heath, Hallicrafters, and all varieties of MIL OD and grey. I'm sure any reputable automotive parts supplier in your area, with a good paint department, can do the job for you, to include spray cans.
de K3HVG

* for black wrinkle I use Pep Boys.

Looking for the specs on this cap. From the numbers, I'm just guessing 42-500 pf 10 KV. I'm not familiar with this company but it says Union City, NJ.

Thanks,

Jim

Anybody know what the going price for a socket and chimney for
a 4CX1500B? It looks like it would be pretty hard to make one.

Interesting point. The BG9D I have is not the same as the BG9DS. The most
obvious is that the crystal is on pins 2-6 not 3-7.  An email to Bliley
hasn't yet been answered. Might have been a special version.

So I am not sure of the other specs either.

Steve.

Google it.

Saw a listing @ Surplus Sales of Nebraska & think it was 3kv
or 5kv, for lotsa money, but anything "obsolete" has a
```

sellers' market. I once wanted to replace the coil of a
simple $15 coax t/r relay and got a quote of $495 at one of
those "supply" sites.

I've seen them go for anywhere from roughly $50 to $200. A good median
price would be $100, depending upon condition. Make sure the internal
screen bypass cap is good!

"Obsolete" actually often means you have to give it away.

How much of something exists determines price, along with demand.
If something is really common, like toasters, then the only way their
price can rise is if demand is far greater.

Let's not forget that for a lot of real boatanchors, there was a whole

period when they weren't wanted, indeed the name "boatanchor" is a
reflection of that, something big and not necessarily valuable so you
might as well tie a rope on it and use it as an anchor.

So 35 to 40 years ago, SSB had settled in and yet there was a still a
lot of AM gear in people's closets, and they wanted to get rid of it.
But since few were interested in it, it went really cheap. I went through
a whole bunch of stuff in 72/73, because nobody really wanted it and as
a new ham I had no equipment.

That period helped to winnow it out, so decades later when people decided
they shouldn't have gotten rid of that DX-40 when they got an SSB transmitter,
and that PMR-8 receiver when they got the matching SSB receiver, there
were less units available of each model, while the demand had increased.
Then demand is higher than supply, and then sellers can set the price.

Or even better, go to:

http://www.mvps.org/winhelp2002/

and get thier hosts file which will block LOTS of ad sites. And qrz.com
is NOT included in it.

Highly unlikely.  What possible reason could his ISP have for blocking
something as obscure as QRZ.COM?  The problem is likely much closer to
home.

Corrupted routing tables.

Go to the command window on the pc. You said that "ping qrz.com" doesn't work. How about "nslookup qrz.com?" If that doesn't return a valid numeric address, your ISP's DNS has gone wrong. Then try "tracert qrz.com" which should show you every router between your desk and qrz.com... and if it shows you a bunch of stars somewhere, data isn't getting to that link.

If the nslookup works, and tracert doesn't work at all, it could well be a hosts file issue. If that's the case, tracert to the numeric address that nslookup gives you should work.

After eliciting help from various people, and trying all the standard PING and TRACERT and all the traceroutes and other stuff, nothing was ever discovered, the packets just disappeared. Using a Traceroute the first ping would disappear in Savanah never to be seen again. Other times, they would bounce all over the USA, never to be returned.

I sent off a few E-Mails to QRZ.COM after doing a WHOIS on them, and all of a sudden magically this afternoon was able to connect to QRZ.COM. However, I was not able to go in and update my E-Mail address (company listed went out of business some years ago) as it seem the User Name and Password have gone into the aether also.

Anyway, at least can now see all the good information on the site.

Thanks for your suggestions and help.

Actually, most networks today block ICMP packets making ping and traceroute of very little value. Observe a ping from within my Department's network:

```
ping -c 5 server2.cs.uofs.edu
PING server2.cs.uofs.edu (134.198.169.3): 56 data bytes
64 bytes from 134.198.169.3: icmp_seq=0 ttl=64 time=0.195 ms
64 bytes from 134.198.169.3: icmp_seq=1 ttl=64 time=0.273 ms

ping -c 5 server2.cs.uofs.edu
PING server2.cs.uofs.edu (134.198.169.3): 56 data bytes

--- server2.cs.uofs.edu ping statistics ---
5 packets transmitted, 0 packets received, 100% packet loss
```

They have been used for way too much abuse and one more useful INTERNET tool is gone.

As I stated earlier, it is most likely that he has somehow told the MS Firewall to block these addresses (very easy for the inexperienced to do as the MS Firewall is not very well done). This would result in exactly the behaviour he is seeing with only a select few sites returning timeouts while most of the net works just fine. I would try turning off the Windows Firewall and then trying to connect. If the connections are then possible you know the problem. Just be sure to turn it back on and then try to fix it.

bill

In the folder there is a file named hosts
C:\WINDOWS\system32\drivers\etc\hosts . No suffix just hosts. It might
have the address you want to log on to in it. If it does, that address
is blocked... You can edit it with Notepad...

The official "IT" answer:
Just another example of entropy, the natural tendency for complex mechanisms to degrade into chaos..... [smile]

Typically, if you do a tracert qrz.com from a dos window (start, run, enter cmd and press enter, then type in tracert qrz.com) you will find out where things are breaking down. This is not always the best way, but typically gets you information on what is going on. Now that it works again try it and note where you are routed on the way to qrz.com. The list may be significantly different than what you saw when it was broken.

The whole internet relies on a number of core routers that pass traffic from one part of the netwoprk to another. When one of these core routers or a path fails, there are alternate paths and routers that are supposed to be used, all automatically. Unfortunately, if someone mis-programs one of these, everything goes into nowhere until they discover the problem and fix it. Needless to say, there are typically some high-dollar accounts that monitor traffic all of the time, and it doesn't take them long to determine the paths are down and start making phone calls.... (I've actually recieved calls from my provider (at work) within moments of losing connectivity, though sometimes it takes them hours to get things fixed...)

It is often helpful to know what your "normal" paths are by doing tracert to your favorite sites when things are working so you can see what is going on when things go bad... I've had odd outages that prevented routing to specific sites for hours to days, when almost nothing else was affected. Some of these seemed regional or local in nature (that is, other people I contacted had no difficulties from their locations, while I would lose the path). Typically, it is not unusual to find that when you experience a difficulty, you will lose path within two or three hops from your location. Generally speaking, once you get more than a few hops out, you will typically get to where you want, unless the site itself is down.... One of the things to look for in a tracert is a loop. Often I've noticed that when there is a problem, after some number of hops, I see the same two or three addresses repeated. As an example, hopping from here, I might see San Francisco, then Denver, then Chicago, then Atlanta, then Chicago, then Atlanta, then Chicago, then Atlanta... In this case there's a loop from Atlanta, who is routing back through Atlanta. When things work for the same tracert, the path goes to Atlanta, then Miami, then to the end web site (for this example). If you see a loop, you don't have to wait long for a fix, as a bunch of traffic is likely involved and they don't waste any time getting it fixed. None of this has anything to do with the destination site in any way, nor is it under their control. Sending email to them is typically not useful, as they don't have any way to determine where the problem originated, nor any way to have the paths debugged, unless it involves nearly all of their traffic...

One day, things will silently just grind to a halt, and everyone will be sitting at home or work trying to go somewhere, with nothing happening... It will be a sad day for the internet, but will probably result in another, pay per packet network alongside the "free" internet, where you or I pay a small amount to have our traffic routed over the "premium" network. Of course, spammers won't be able to pay the freight, so will tend to trickle away and we may finally get rid of most of them. One can only hope.

Hello and thanks for the read.
Now on eBay - a very, very nice Hammarlund HQ-215 receiver + in another eBay listing, the matching S-215 speaker + in other auctions, the Collins 500kHz & 6.0 AM filters.

Why are you breaking the set apart? I can understand that you might be
selling the speaker in another auction, but why are you removing the
standard filters? Or are these extras, in addition to the mechanical filters
that come stock with the radio?

Pete

Have a few more days left for our auction of HRO-500 mint manuals
(original!).
See "jerrymyr" auctions on eBay.
Thank you!

Will be listing mint, never used HRO-500 parts soon.

Thanks

Jerry

For those who were interested in the BG9D 100 kHz thread, I posted some more data on the part and its associated ovens. All thanks to Dana at Bliley.

For your enjoyment:

Data sheet: http://novatech-instr.com/Fun/BG9DS.pdf
Oven flyer: http://novatech-instr.com/Fun/BlileyOvens.pdf
TCO serieas: http://novatech-instr.com/Fun/BlileyTCOSeries.pdf

These are the ovens mentioned in the BG9D data sheet.

My oven is going to be really simple, as the stability of this ancient part isn't worth a lot of work. I have a deep drawn aluminum can about

1.4 inches in diameter, on which I am winding 100 turns of #28. This will give about 10 watts on 6v. The temperature sensor will be an LM60. I will calibrate the temp using my Fluke thermometers.

Now I need to get back to work.

Steve.

Hello to the group,
    I have been restoring a Hallicrafters SX 140 and it now receives
well and is quite sensitive, but the S meter barely moves. Is this
normal for this receiver or should it move quite a bit like most other
Halli's? Does anyone know if there were any errors on the schematic or
if this radio has any trouble spots? Any hints? 73 Mike KF6KXG

Dear Rick;

Thanks for the tutorial, I am somewhat ignorant of the mechanis of the net, and it was very good.

I got a message form owner of QRZ and he said that if I used a router it was the problem, to unplug it and then plug it in. However, it had restarted on it's own before trying that.

I used to have a really nice program that would let you ping a site, and it would draw a map of the route even outside USA, and gave all kinds of data like IP and delay times and a really nice graphical presentation, and you could actually select several types of presentations. Do you know the name of that program, as it was excellent and even a rank amateur like me could use it and get meaningful information. I think it would also give you a "state of the net" table with highlighted problem spots having excessive delays, that is in the main switching centers. Can you enlighten me on that program, I want to dig back and see if I can find it?

Look at the voltage on the AGC line and see. If the AGC voltage is
in the ballpark, there's an issue with the meter or the resistors that
feed it. If the AGC voltage is way off, the receiver may be TOO
sensitive.

Hey folks, I am looking for a CV-591A SSB converter for use on my
R390A/URR receiver. Depending upon the converters condition, I may be
willing to pay up to $500.

If you have a CV-581A sitting in your collection please contact me at
Tisha.Hayes@nospam.com

Replace nospam with gmail. Thanks

A short while back I posted my findings on an SX-140 resurrection.
You should be able to find it by searching here.  Silver mica disease
is all too prevalent nowadays so if thats not an issue for you then
the rest is pretty reliable.
As for the meter...I really haven't paid much attention to it because
its such a cheap bouncy thing but it does seem to read about what I
would expect.

Most of the strong AM signals received on my National HRO are affected by hum.

I put a ceramic capacitor in parallel to each of the 80-type vacuum diodes with no noticeable improvement. Does anyone remember which other cure was proposed to solve the problem?

Before someone gives me a simple answer, I confirm that the electrolytic capacitors were checked to be good and the DC HV is perfectly filtered. No hum in absence of signal.

Are you sure the hum isn't real? A lot of solid state
devices trash up the power line. Rectifiers are a big
source, lamp dimmers and fluorescent lamps are another.

Barring that, look for heater cathode shorts from the
detector tube back to the power amplifier tube.

Tunable hum is sometimes caused by bad bypass caps, its worth checking. This could also be intermodulation from something in the neighborhood especially if these are strong signals. Can be checked by using another receiver, preferably a battery receiver. Someone else mentioned hummy tubes, also worth checking.

Putting a ceramic in parrallel with the filter caps may help but I think its more likely a decoupling or bypass cap has gone bad.

If you pull the detector tube out, is there hum? How about the last IF tube? How close to the front end can you get before there is still hum after the tube is pulled out?

Tony

I'm assuming you're talking about tuneable hum, where the AC line frequency modulates the received carrier.

Does the receiver have AC line bypass caps from each leg of the AC power to the chassis? Have you tried grounding the chassis to a good earth ground to see if the hum modulation level is reduce? If grounding helps, you should
check to see that the bypass caps are installed. Also adding ferrite snap on cores on the power may help along with the ground connection.

I think its MAGNETIC coupling from the power transformer to the audio transformer.

If its an older HRO, and it has to be with a type 80 rectifier, the power supply is on a separate chassis with no way that hum could be induced into the output transformer. In any case, this would be quite low level hum. Much more likely to be hum modulated onto the carriers due to poor grounding, bypassing, etc. The HRO was always a well designed and well made receiver and should not have this problem.

Thank you Scott and Bill for your suggestions. After some more time spent on it, the S meter will read almost full scale when picking up a nearby sig gen or for the built in crystal calibrator, but barely moves on other signals. I replaced a tube, most caps, the out of spec resistors and checked the pots. Could the caps in the IF's be bad if the audio reception works well but the S meter only work on very

strong signals? I thought the symtom of bad IF caps is thunder crashes
and poor audio. I haven't found anything pulling down the AVC. 73 Mike

While I am not familiar with this particular rcvr, if the pwr supply
is on a separate chassis and is connected to the main chassis with a
cable, would a bad ground connection in the cable or plugs (if any)
cause this? Maybe try running a temporary wire from chassis to chassis
to eliminate the possibility. 73 Mike KF6KXG

While I am not familiar with this particular rcvr, if the
pwr supply
is on a separate chassis and is connected to the main
chassis with a
cable, would a bad ground connection in the cable or plugs
(if any)

cause this? Maybe try running a temporary wire from chassis
to chassis
to eliminate the possibility. 73 Mike KF6KXG

Its certainly worth a try. I am not sure from the original poster's question if the hum is constant or is present on some stations. Both conditions can be caused by poor filter caps but the second is more likely to come from something else. Strong RF pickup from a poorly grounded supply would be one of the causes.

If these are broadcast stations (would mean he has one or more accessory coil sets) another tool would be a simple loop antenna, perhaps two turns of wire around a shoebox sized form. This will give low enough signal strength from local stations to avoid front end overload and will also help to track down modulation coming from sources external to the receiver. And front end overload is certainly another possible cause.

Bad tuning caps in the IF can cause frequency instability. The tuning may change from cold to warm. This is typical of bad mica caps. Bad by-pass or decoupling caps can cause instability in the form of oscillation, low gain and other problems. Paper type caps can go bad with age and should be replaced with more modern ceramic or plastic types.

I think the mica cap desease mentioned above may be a rapid instability which shows up as an irregular warbling where the caps are in the local oscillator. This is sometimes called scintellation. I am not sure of the cause but it seems fairly common in silvered-mica types in molded cases.

If this is the case, putting a piece of thick sheet steel between the
two transformers will change the noise, for diagnostic purposes. Then
you can try and reorient the transformers to reduce coupling.

My problem is called "tuneable hum". It has nothing to do with filter capacitors, transformers coupling, cathode to filament leakage, etc.

It only shows up on certain stations. It depends on the path followed by RF signal (e.g. if it passes through the rectifiers).

Typical cures are:

- bypass capacitor across the power supply rectifiers
- bypasscapacitor between mains and ground.

But there still are some stations affected by a considerable hum. I was seeking some suggestions on what to do more.

> "C'est un Nagra. C'est suisse, et tres, tres precis."

My problem is called "tuneable hum". It has nothing to do with filter capacitors, transformers coupling, cathode to filament leakage, etc.

It only shows up on certain stations. It depends on the path followed by RF signal (e.g. if it passes through the rectifiers).

Typical cures are:

- bypass capacitor across the power supply rectifiers
- bypasscapacitor between mains and ground.

But there still are some stations affected by a considerable hum. I was seeking some suggestions on what to do more.

In the HRO, the power trasformer is maybe 20 inches away from the audio transformer.

My problem is called "tuneable hum". It has nothing to do with filter capacitors, transformers coupling, cathode to filament leakage, etc.

It only shows up on certain stations. It depends on the path followed by RF signal (e.g. if it passes through the rectifiers).

Typical cures are:

Tony

Have you tried using an external balanced antenna? Is this problem occuring
with a random length antenna wire that is using the AC lines, etc. as the
counterpoise for the antenna system? Some more information on the antenna
might provide some clues. Tuneable hum shouldn't be a problem when
using an external balanced antenna.

Tunable hum from the power supply where the filtering is good is found mainly in AC/DC receivers. There are other sources, mainly lack of bypassing especially of the screens of tubes with AVC on them and heater to cathode leakage anywhere in the RF path. In either case the tube or tubes affected can modulate hum onto signals. Since AVC tubes are operating with a non-linear characteristic they can be pretty good modulators.

If you have access to a good tube checker, one which will indicate shorts and leakage, test the tubes with it. A tube may test fine for emmision and transconductance but still be leaky. Bypass condensers can sometimes be checked by simply paralleling the cap with a good one but, if its got low enough series resistance this test may not work and only substituting another, known good, cap will do.

You are working on a receiver of first class design which did not have this problem designed into it so it must be coming from a defective component. The tubes and by-pass or decoupling capacitors are the most likely. However, I would also do a routine check for correct tube socket voltages and resistance values. These can somtime give you a good clue as to what is wrong.

Note that where tubes on AVC are concerned tunable hum can vary with the strength of the signal and with the setting of the RF gain control. This may be another clue.

You have not answered my question about getting the same hum on other radios at the same location. There are conditions where the actual signal can be modulated by somthing often high voltage power lines nearby. This is an

```
effect familiar to those with auto radios.

Does the fellow who makes replica dial scales for HRO-60 receivers read
this group? I would like a word with him. I need some.

Address below always works. declercq@gdls.com sometimes works.

Jim

All,
There is a listing on eBay for this Pilot radio:

http://cgi.ebay.com/ws/eBayISAPI.dll?
ViewItem&item=130198633640&ssPageName=ADME:X:RTQ:US:1123

It is advertised as a T704. I have never heard or seen a T704, but I do have a T502U, which is the EXACT same radio, except the dial on the T502U just has Pilot Radio on it. The T704 has Pilot Junior. I am somewhat skeptical of this set for the following reasons.
1) The white Plaskon is just TOO white. Ivory was the color that these sets were produced in, the T500 (all Ivory) and the T502U (Ivory and Brown) has this off-white color that was pretty much the same shade in each model.
2) The product tag on the back of the set looks like it may be a replacement. I know from experience that on T500's and T502U's, the product label/tube layout was on the bottom of the set.
3) I asked the seller if he could send me a photo of the bottom of the set as I was curious about this anamoly. His answer was that the set is already packed and waiting shipment. I, for one have NEVER pre-packed an item, just in case an interested buyer wanted more photos.
I leave it up to you folks to check this set out and see what you may think.
rgds,

Mark S.

Hi Dick,

thanks for useful info.

I have to carry more tests on my HRO, including that of connecting my Yagi antenna to it instead of a short indoor piece of wire.

I must also try to connect that same piece of wire to another receiver, to see whether there is any difference (actually I have a second HRO to compare).

The hum heavily depends on signal strength and on the particular station (there are some with no hum at all), so I would tend not to attribute the cause to internal tube leakage.

Your supposition that poor screen / AVC bypassing could be the cause looks interesting and I will do some tests at that regard.

However I did not fully understand your argument that putting a capacitor in parallel to an existing one may not a good way to do the test. If I use a low-ESR capacitor, why is the existing one not out of the game?

Thanks and 73

Tony I0JX

When was your similar looking model made? The one up for auction has
a 1950s tube lineup according to the sticker on the back but that
definitely looks like a 1940s radio.. and the knobs look late 30s if
you ask me.

Yet I wonder who would go to so much trouble to reproduce a sticker
for a relatively uncommon radio...

Regards,

Jeremiah

Take the broken one to your local college's pottery studio and ask if
someone can make you a porcelain one. The shape will change a bit when
it's fired, so you can't necessarily get tight tolerances on holes.
Consequently you make the holes small and then drill them out with a
ceramic bit. Or you make them large and accept the slop.

I have tried from 3 different computers to access QRZ site and it
won't connect, saying server is down. I wonder if anyone else is
having trouble connecting too?

Jim

Comes up fine here Jim at 21:51 UTC

I notice QRZ used to list birthdates but seems to have discontinued that
info for new licenses ??

But all E-Mail addresses are no longer in ASCII but now in graphical format
that helps to prevent spambots

Bravo QRZ

Okay, so I broke down and got a couple of Bliley glass octal 100 Kc
frequency standard crystal, model BG9D.

Now I am looking for data on this part. Google doesn't turn up anything, other than some nice photos (http://www.leapsecond.com/museum/earth/osc-100khz-tube.jpg)

Anyone have a data sheet on this thing?

It is easy to hook up, but it would be nice to know what drive level and load it was optimized for.

TIA.

Steve.

I am building a crystal tester and the circuit calls for two 220pf
caps in the oscillator. I didnt have any of these caps in the junque
box so I thought about making a couple gimmick caps. I understand this
is done by twisting some insulated wires together. Is there some guide
to use that will give you an approximate value? In other words, if I
have twisted some #26 enameled wire together does 1" equal some pf
value? Any info you may have on this will be appreciated.

"Gimmick" capacitors are only good for a few pf, and are
used to do light coupling or introduce
feedback/self-oscillation. even if you could build one, it
would be pretty unstable for test use.  220 pf is
substantial (an air capacitor would have many plates).  In
the day, we'd use silver-mica type capacitors for stability.
  If other friends' junque boxes are available, I'd try
those.  Thank goodness for modern meters--at my age, reading
the color codes is hard!

Yes, the more I have lookad at it 220 pf would be too large for a
gimmick. I will keep digging in the junque box, maybe find a few other
values to series or parallel to get close to 220 pf.
thanks, w5kcm

"Gimmick capacitors" are when you need only the tiniest amount of
coupling. They are just a step up from placing a wire near another one
(such as when there is enough stray coupling from a bfo to a diode

```
detector for a sufficient beat).  They are likely sub-pF, and if
they are any higher then a couple of picofarad.  In other words, the
value needed is so low that you can get by with a pair of twisted wires.
If you need something substantial, then you use a real capacitor.

Another advantage of a "gimmick capacitor" is that it's somewhat variable,
sicne you can adjust the twist and even trim the wires to get a different
capacitance.

Gimmick caps in that range are probably made from sheet metal cut out of
tin cans. I find Altoids tins work well.

Use a cheap DMM with a capacitance function to measure them... then cut
them down until the value is correct.

I could only suggest your searching for an old Allied Radio
catalog. I remember seeing Bliley as one of the brands
listed, and there were usually parameters there. You
wouldn't be too wrong with an ARRL Handbook circuit, if
you're going "tube." There's enough "wiggle room" in the
tolerances. Tube-type pre-PLL decade dividers, mixers, and
multipliers weren't even twinkles in the designers' eyes
when those xtals were ground.

Wait a minute.  Hammarlund made variable capacitors.  ANd the moment
I saw the subject header, it was clear to me he's looking for a 50pF variable
because of the context.

Thanks.

I found some pin-out and some simple info. I didn't think of any old Allied catalog.

Bill, I think that I put my hand on a 50 uuf air trimmer cap
that I can send to you gratis. I may have a larger frame
type, but I'd have to get something (plus shipping) for it.
  If you can post the equipment you're trying to obtain it
for, we can work further. Get the info to me quickly--If I
don't have it, there's a local swap this Sunday where it
will probably be sitting on someone's table.

Nice-looking girl on the site! Is that your XYL?

Jerry, W9NPI

OK, last night I found another stash with some capacitors and found a
couple small 200 pf silver micas in there. That should work. Thanks
for all the input. Not sure about the Jack Benny, that one sailed
right over.
73, Randy

They did, didn't they? I'm not sure what the context is here.

But, I have a Hammarlund APC-50 here... this is one of the ones with
the 1/8" shaft with a locknut for screw adjustment.

If you want something with a knob I have a bunch of 100pF ones, but they
aren't Hammarlund brand.

I want to thank all those who helped, especially Dana at the Bliley
corporation who sent me this:

http://novatech-instr.com/Fun/BG9DS.pdf

Same pin out as the octal crystals used in the BC-221 (DC-9) and others.

Building a 70 C oven will be kind of fun.

I wonder how good it will check against the GPS locked Rubidium standards
at work.

Actually, it was Meshna surplus who caused my fixation on prefect frequency
with his "10 FT-243 Crystals for $1" many years ago. Postage was cheap in
the 60s.

Thanks again.

Steve.

Meshna. Yeah, he's why I learned to spread grit & water
over a piece of glass, use a figure-8 motion 6 times, turn
the quartz square 90 degrees, repeat the figure-8 motion,
etc. Mom wouldn't let me play with Hydrofluoric Acid, for
some lame reason. Even drilled & tapped some FT-243 holders
to vary pressure on the spring so I could VXO on 15-meters.
  THAT Meshna...

Now I know I want to find another one of these. I think I've seen one
in my stash upstairs.

A couple of years ago I was working on a crystal oscillator and watched
as the one I had rolled off of the bench and went "Pock!" as it hit the
floor.

Sigh....

Jeff

Somewhere in my stash I have a similar 100 kc octal crystal except that
it has a metal envelope, sort of like a 6L6, rather than glass, and IIRC
it has a military part number of some sort.

So the question is, what are these good for, can they be converted into
a useful project of any sort?

Regards,

John Byrns

Well you make a 100KHz crystal calibrator so you can get a better idea
of where your analog radio is tuned.

I'm still wondering why these are in tube type cases. It almost suggest
they are better than average crystals, and makes me wonder if they actually
have some sort of heater built in.

I actually have a 1MHz crystal that does have a heater element. Big metal
thing, though I can't remember if there's a thermostat there. It's from
an AM broadcast band transmitter.

I just googled bliley and they have a nice website.

Have you tried contacting Bliley directly?

> have some sort of heater built in.

They're just a bit better than the tall HC/6-U crystal holder. And less
prone to enviromental issues than the FT-243 type holders.

The "tube" versions usually don't have a heater built in.

> So the question is, what are these good for, can they be converted into
> a useful project of any sort?

With the availability of crystal oscillator assemblies having better
than 10^-12 stability and and accuracy, there's not much you can use
one of these old crystals for. That being said, they're fun to set up
with a square wave output so you can use them as a "calibrator" for
a SW radio at the 100 KHz markings.

Michael Black wrote:

That is a typical oven type which is used as a reference oscillator.
The ovens came in two separate versions, for the most part, they had
the oven and control built in. A few of them just had a heating element
and temperature probe.

Jeff

A crystal oscillator will not achieve 10^-12 on its own.  10^-12 is the
```

```
stability of a Stratum II atomic clock.

Thanks all for the answers & suggestions. Two problems were found. One was that the microphone had a broken wire in the cable. The other problem was between the ears - this is the first SSB transceiver I've had (tells ya how long I've been inactive), and I was expecting power to show on the output meters just from keyng the mike (you know, from the carrier, which is nonexistent). Transmits fine now.

Well, to answer "What are they good for?" Really nothing. I have rubidium and xtals locked to GPS and can easily get to 10e-12. With some of the work I do, 1x10e-8 translates to "broken."

However, I also play with old radios, so why not have an "old crystal calibrator" sitting warm on the work bench. I am kind of excited to homebrew an oven. Temp sensor are easy these days. Or is that cheating?

That's why I posted to this group, not sci.electronics.design.

Just something fun to do while I am waiting for football to start again.

Steve.

Well it is not Bliley ... but a 10 MHz crystal should for an oscillator to
mate with my Motorola Oncore GPS receiver .... poor man's standard.

For some reason I still can't get on. If anyone has any
suggestions as to what could cause this please advise.

Jim

I even tried doing google search, then trying to link there, would not
open, just times out.

What is a "Host's File" and where is it located? This is really strange.

Clicked on your link, got the same reply, after about 45 seconds
it says "Server Timed Out". Tried 4 different computers, different
browsers, etc.

I looked up the HOSTS file as mentioned above, then deleted it
as suggested in this article, same results.

I looked up QRZ's IP address, and tried pinging it and guess what?
It timed out, saying the packets were lost.

I tried sending an E-mail to "help@qrz.com explaining
problem, no reply yet, is that the right address to send an
inquiry to?

I am using McAfee Internet Security and looked in the firewall
permissions, nothing blocked there.

I need to get in and update my data.

Anyway, don't know what else to try, open for any suggestions.

thanks,

Jim, wa5dxp

The magic word to make it work correctly is "ooooola" repeated over
and over until you begin to hear foul language from the speaker. This
is best done on the air on top of an existing QSO :(
Then you know everything is working.

Well, my previous transmitter, last time I was on HF, was a BC-610...it was designed well before SSB was even thought of.

Short term stability on a 6C4-based crystal oscillator is pretty good...
the phase noise is going to be lower than some PLL bench oscillators.

Long term stability... it's not very good... it's not good enough to pass
current FCC broadcast standards, even, without a really good oven.  On
most of them you can see the frequency jump back and forth as the thermostat
opens and closes....

You have a file in winblows called hosts. It is designed to allow for hardwired mapping of abstract domain names, like qrz.com into their physical ip addresses (123.123.123.123). Typically the hosts file is used for mapping your fixed domain named devices such as printers into their fixed ip address.

A while back, some folks discovered that they could abuse the hosts file by stuffing all of the domain names of advertisers, spammers, crackers, etc. into the hosts file, and mapping their addresses to 127.0.0.0, which is basically the ip equivalent of a dead letter file.

When you try to access a domain name that has been mapped to 127.0.0.0, in your hosts file, you get a timeout and then a 404 message.

qrz.com has been placed in your hosts file by one of the trashy antivirus

or antispam programs on your winblows system. You probably did this by
randomly pressing your right mouse button when last on qrz.com, and told
your antivirus/spamfighter machine that qrz.com was a site that needed to
be blocked. You need to go into explorer, find your hosts file, and
remove qrz.com from the list.

-Chuck

I will assume you are running Windows XP or newer.  Try turning
the Firewall off and then try to connect.  If it works, you have
```

somehow told the firewall to block those addresses. The trick
then would be figuring out how to unblock them in the firewall.

Proportional control, with modern parts will really help. My lab is
20C+/-3C, so getting 70C+/-1C should be pretty easy. Unfortunately,

that will still be pretty sloppy (about +/-1ppm). Just fine for
boatanchor calibrating and frequency spotting.

Steve.

Looking for some GT550A accessories:

The external VFO: RV550A
The console: RF550A

I'm getting towards the completion of a GT550A restoration and looking for the vfo and console to start working on.
Please email if you have either item for sale.
Thanks very much,
Emil W9NM

A year ago when greenbacks were actually worth something, that would have
made sense. No longer, though.

Yes, I'm being a Brazen Neighbor, but I see that my notice
of a Q-multiplier auction is next to your message. Also,
after referring to a copy of your receiver's manual at the
BAMA site, I see (a) No selectivity, and (b) You'd only have

to move the ground pin on my QF-1 to make it compatible to
the '57. Just a thought...for something you could use after
you fix the problem...
Regards,

-afcsman-

An old radio collector in Italy sent me these photos of a BC-312 rebuilt
in France:

http://novatech-instr.com/images/Fr_BC312_1.JPG
http://novatech-instr.com/images/Fr_BC312_2.JPG
http://novatech-instr.com/images/Fr_BC312_3.JPG

He asked if I knew anything more about this. I thought I toss it up to
the Usenet crowd. Note that there aren't the 3 holes under the
nameplate, so this is probably a whole new front panel.

For a radio designed in 1936, that's pretty long life.

Steve.

Can't add much, but I remember seeing a BC-603 receiver with a similar
nameplate, though I can't recall if any of the other markings were in
French.

Steve/Mike,

I have a BC-669-C and power supply that is marked in French both inside and out, it came to me from a seller in France and was used by their army in the artillery support role. Not sure if the French replaced the original markings themselves or if the makers in the US lettered them up for overseas orders. My set was made by ERL but has a Hallicrafters control box.

No matter how it got done, there's a lot of work in tearing
down the front of a BC-312.

I have a CCA Very Good to Excellent grade Collins 30L-L amplifier for sale. It is a Round Emblem version, Serial Number40385. It is in really nice condition and works perfectly. It is almost perfect. It would be a solid Excellent grade if it where not for some extra holes in the back panel of the cabinet. These look factory, but I have never seen a 30L-1 with these extra holes. You do not seem them from the front and they are not distracting from the back. This amp has a full set of brand new old stock Jan/RCA 811A tubes. It comes with a color copy of the manual. I am asking $850 plus shipping from 79602. This has been my keeper amp for years, but I have not used it much. Digital pictures available. Thanks, Charlie Hugg, K5MBX

Hi Ted;

I got the relay yesterday and installed it, all back to normal operation, thanks to your leading me to the replacement part.

Jim, WA5DXP

I recently acquired a military signal generator, but don't find any model number info on it. Searching the web, I see it's similar to a AN/URM 25E, but mine has the frequency display windows arranged horizontally as opposed to vertically, and there may be some other layout differences. This SG covers audio to 50 megacycles.

Here's a photo:

http://picasaweb.google.com/kennnick/HamRadioEquipment/photo#5162024745677349650

I think the info may have been inside the lid, with is missing.

Well I'll be darned; that's it exactly. Except of course for the
nameplate. Thanks Jerry.

Hi,

Unfortunately I can't list this item as for sale world wide as I use to be able to in the new Ebay seller's tools. In order for that to happen, I need to know prior what the shipping weight, and shipping costs would be! That's not possible so I have to show it as US. I will ship it ANYWHERE as long as the buyer is willing to pay the shipping charges. Drawing conclusions and assumptions without asking a question through the auction is quite simplistic on your part. If you're a serious buyer on this item, then please ask all the questions you like and I'll give you answers as best I can. If not, then your comments and premonitions of things are incorrect. Send an email off to Ebay to bring back their old auction format and then all sellers could list it so it shows up as available internationally. Seems like some folks forget there are other places in the world besides the US. A good geography atlas or looking at a few world maps would show this.

Hi All;
A real nice, no dents, scrapes Gonset GPP-1 fone patch with manual
copy for $30 + Postage from 33952.
Only mod, which is a good one is that there is now a 2 pin amphenol
female plug on on either side on the original "transmitter" & "Mike"
connectors on the back, nicely done.
Regards/73......
Rich WA2RQY/4

Well no.

These are discussion newsgroups, and you posted here so that left it open to discussion.

The fact that the fools who created this newsgroup thought buying and selling was such a key part of the sub-hobby of "boatanchors" meant the charter for this newsgroup is wishy washy and lets ads in. But, the wording is such that this newsgroup was never intended to be primarily a buy and sell newsgroup.

If you post here, you must expect to see replies.

The fact that you posted an ad is likely an even greater reason to see comments you don't particularly like.

The original point of course is interesting, since the flow to the US always seems easier than the flow into Canada. ONce something is out of the country, it's less likely to come back.

$130??? Are you NUTS? You're about $100 too high there, on a GOOD day. $300 Buy it Now??? hahahahahaha

Last one on Ebay didn't even bring his start of $25.

Oh, and yours must be REALLY heavy - the other guy only wanted $20 to ship it. $43 for shipping a 3 pound unit????

Good luck there Paul

after finishing my restoration project of a hallicrafters SX 100 I need the
power transformer to bring it in the origional condition
I have a number of hallicrafters but the SX 100 is the best of them !
thanks hans

They are very good, *except* their mechanical instability is horrible. I could never use a key or bug on the same table with the receiver. Mine was new.

I bought a brand new one in 1957. Couldn't wait to get it home and listen to some SSB transmissions. I set it on our bed and plugged it in. Just touching the bed sent it warbling all over the place. About the least stable receiver I ever owned.

Does anyone know of someone who repairs meter movements (d'Arsonval, Weston etc)?

OR of an S-meter for a Hallicrafters SX-24 or SX-25?

Thanks.

I have a nice Kenwood TS-940SAT for sale. It is Serial Number 7120084. It has the optional YK-88C-1 500 Hz CW filter installed. There is a factory sticker indicating that this radio went back to Kenwood on 2-14-92 for updates. The transceiver receives great and has fantastic audio. It transmits on all
bands with full output power. Everything seems to work but the automatic antenna tuner. It does not go into tune position so does not do anything when the AT button is pushed except indicate on the display that it is already tuned. Cosmetically the transceiver is in good condition. The cabinet is very good. The dial lights and frequency readout and sub display work fine. There are some nicks around the trim of the front panel, but the front panel is very nice. It comes with a copy of the manual and the AC power cord. Price is $675 plus shipping. Thanks, Charlie Hugg, K5MBX

```

Hello, all. I am now able to supply new multi-section can-type filter capacitors for the HW-16, as well as full HW-16 power supply re-cap kits.   These are not on my web-site (www.hayseedhamfest.com) as yet, but here are the main details:

HW-16 MULTI-SECTION CAP:

These are fresh, brand-new capacitors in twist-loc type cans, as per the originals. They are not N.O.S. or re-stuffs.

They are a drop-in replacement for the original cap - no modifications needed.

They are intended to upgrade as well as replace the original unit.

The operating temperature rating has been raised from 85C to 105C.

The voltage ratings have been increased to more realistically handle higher secondary voltages due to today's typical a.c. line voltages.

The terminals are identified on the bottom wafer and also on the can, per the original, i.e. half-moon, square, triangle, and blank. The can is negative (ground), of course.

The terminals are copper for easy soldering.

They will be furnished with metallic mounting wafers.

Below are the specs of the original units vs. the specs of the new capacitors:

```
ORIGINAL (85C)    NEW UNIT  (105C)
40 mfd @ 350V   /   47 @  450V
50 mfd @ 350V   /   47 @  450V
80 mfd @ 200V   /   100 mfd @ 250V
```

80 mfd @ 300V / 100 mfd @ 350V

Dimensionally there are no clearance or interference problems. The height is only 3/16" taller than the original, (3 11/16" vs. 3 1/2"). The diameter is 1 1/2" which is the same diameter as the base of the original unit (the new can is straight-sided, whereas the upper part of the original is slightly smaller in diameter).

The prototype has been produced and accepted. Full production is expected to begin in about a week to ten days.

Amateur net for the multi-section cap = $19.95 ea. + shipping.

Please e-mail me for details regarding availability of other multi-section caps for Heathkit and other ham gear.
I am in the process of expanding the line beyond this first model.

HW-16 P.S. RECAP KIT:

For your convenience, I can supply a complete HW-16 power supply recap kit consisting of the following:

1 - Multi-section cap as per above.
2 - 47 mfd @ 450V 105C radial electrolytic caps (for under chassis mounting).
2 - 22 mfd @ 160V 105C axial electrolytic cap (for the bias supply).

Amateur net for the kit: $27.95 ea. + postage.

Please e-mail me for details regarding availability of other multi-section cap kits for Heathkit and other ham gear. I am in the process of expanding the line beyond this first model.

I do accept PayPal from U.S. amateurs. For ordering instructions or if you have any questions, please e-mail me at tfarl (at) mchsi (dot) com .

Tnx es vy 73,
Tom N�JMY . .

hi guys,

i am restoring an hq180a. been a while since i messed with tubes, (abt 20 yrs) am in need of a little direction. i checked & replaced bad tubes, verified b+ v. 2 problems, may be related??? on top band, very poor reception, & when u adj ant. control, u hit a spot that causes oscellation or motorboating. prob #2...on top 2 bands, cw sigs have a raspy note. not t9 at all. it is a high s/n rcvr 6377. kind of neat, has spinner knobs, noise blanker, & 455 kc if brought out to rear apron. i guess previous owner did mod, but it sure looks factory....solder connections, etc.

would appreciate any and all guesses.

tnx, pete, k2iqk

I suppose it would depend on what is wrong with the meter. I have successfully
repaired a number of different maladies, but I tend to avoid rewinding the
armatures. Not because it is hard, it isn't, but because the wire sizes are
difficult to find. I have #38, and #40 on hand, but nothing smaller.

Hi All;
Its been a while since I used the drake reflector(mailing list).
I wondered why I have not received anything from them?
I tried the Subscribe address on AC6V but that also is NG. Anyone know
if they still exist, thier new subscribe info?
Tnx in advance & 73,
Rich WA2RQY/4

Oscillation and tunable hum can be caused by bad decoupling and by-pass capacitors. If you don't have a handbook try BAMA for one. You may have to shotgun the caps.

good idea..i
have sig gen..1st & 2nd ifs would be difficult because sig
gen calib
not great..i dont think if alignment is my main prob..but
will do all
hf aligns..i'm glad to get back into tubes..its like
restoring a
classic car, but alot cheaper...hi hi. tnx agn..if u have

any more
ideas, pse email me.
73, pete

Again, I suspect the problem is bad capacitors.
Tunable hum is typical of feedback allowed by bad power
supply decoupling caps as is oscillation. I doubt if
alignment has anything to do with it.
Finding the bad caps may be a lot of work but you can
at isolate them to a particular stage of the RX. I don't
know what kind of caps Hammarlund was using when the HQ 180
was made. They evidently learned about Black Beauty paper
caps from the SP-600 and may have switched to ceramics. If
so the chances of bad ones is pretty small but even ceramic
caps don't last forever.
A capacitor checker would be very helpful.

I should have added to watch out for the power supply filter caps also. Bad caps could account for the hum and rough CW notes plus allow some feedback through the power supply although at RF the by-pass and decoupling caps should prevent that. Try the power supply filter caps first.

 It has the market value of used Tampax. Someone will eventually buy
it to strip for parts.

Description (revised)

Item Specifics - Item Condition
Condition:

Used

The serial number is F279 stamped in red ink on the back edge of the chassis. This is an early, early serial number probably prior to 1941. As illustrated in the photo below, only part of the paper label inside remains.

Although tubes light up, this does not appear to work. The meter reads zero with power off but reads 1/3 to 2/3 upscale even with no input.

This VTVM is not all original. The handle appears to be from a kitchen cabinet. The power cord appears to be a lamp cord and only three feet long. Someone has wired what appear to be silicon diodes to the rectifier sockets and put white tape over the sockets.

Glenn Robb has kindly posted HP catalog scans in pdf. One of the catalogs has a description of the 400A on pages 15 & 16 of the scan.

I have not been able to find online a manual or schematic for a 400A as early as this one. You can easily find a schematic and manual for later 400A models that might be similar to this early one but will not be the correct schematic.

I am offering this as found and as is.

Please email questions early in the auction so we have an opportunity to answer.

Please check my other auctions.

Buyer to pay shipping costs. Paypal, money order, cashier's check, personal check accepted. Allow two weeks for personal checks to clear. All damage claims to be made with carrier. No refund until after item has been returned in original packaging without additional damage.

Don't mess with the alignment yet! If you don't have a well calibrated signal generator (a frequency counter to go with it would be better) you will probably just screw up the IF alignment. It is important to get the third if aligned to exactly 60 kHz for the sideband selector function to work properly. You will need a sweep generator to properly align the first (3035 kHz) IF. The IF alignment is unlikely to be the problem with the oscillation. Only attempt the IF alignment if you have the proper equipment and know how to use it. If the alignment hasn't been messed with, it is probably OK.

Make sure all tube shields are in place and all the bypass capacitors are good. The HQ-180 uses mostly ceramic caps, but as mentioned, they can be bad. Replace the filter caps first, then go from there. --Ed

This shoudl be the stadnard LM723 and
2N3055/2N3771 pass transistor on back of case.

Is there anyone who does front panels for the HQ180 ? I have one
in excellent condition except the front panel is quite rusty and
unreadable.

That's kind of like looking for when Bush is lying...it's when his lips
are moving. How do you know if they're leaking? They're the paper
ones--they all leak...or will.

Bill, if you don't get an answer during the day, I'll check when I get
home from work and send you the info. I'd also be glad to make a clean
copy of the article if you need it.

Check this site for pictures of my antique radios in house at this time,
but several will be offered on Ebay in the next few months.
Tnx for looking:

```

I have recently bought a National HRO-5 (octal tubes, rack mount) with a power supply different from that of another HRO receiver I have, which is the well-known dog-house type.

I would like to determine whether the new power supply I got is original or it comes from somewhere else. It is absolutely not an home-built supply, but I cannot exclude that it was modified by someone in some respects.

You may see it on http://www.qsl.net/i0jx/hro-5.jpg It has a type-80 rectifier, and the socket on the chassis side has four pins (like the dog-house supply).

Any advice would be greatly welcome.

Also, I would be interested to know where that speaker comes from.

Thanks and 73

Tony I0JX

Hi Tony...

Perhaps it's a part of a rack mount power supply. See:

```

hello
john wrote about improving the stability of the SX100 by soldering wires
beteen the tuning cap and the shield
are there more solutions to solve the problem ?
anyway I like the sx100 better than my SX 28A because the S X 28 drifts very
much . The sensitivity of the SX100 above 15 mc is also much better and with
the calibration it is more easy to find out where you are
I seldom use my SX 42 don 't like the tuning ,but great audio
hope someone has more advices for the SX100
hans

I recently acquired a fairly decent Hq 180 for a good price on
ebay.The issues I have with it are slight rust on the front panel and
chassis.What are the best ways to repair this damage?
Some one emailed me a infor on a person that could resilkscreen the
front panel but the 300.00 price was out of my budget.Also
electrically the receiver appears to receive very well except on the
top band background noise al most drops to nothing and signals jump
out of a very quiet background.Is this normal for this receiver?
All voltages and tubes have been checked and are in spec.
Thanks in advance for any replies.

Thermal stability of the SX-28A can be improved. So, if you like it, except for that problem, get an old Handbook out and read the section on temperature compensation. A frequency counter, hair dryer with nozzle to direct the heat, a calculator and a handful of temperature compensating caps can become a pleasant evening project.

The mechanical stability issue of the SX-100 involves mechanical analysis of the mechanical assemblies of that receiver. There is no simple mechanical change that will fix the problem perfectly, rather the scientific approach would be incremental. Stiffening up one assembly may simply transfer the torque somewhere else. The simplest approach may be to isolate the entire receiver from outside influence. If no outside stress is allowed to influence the radio, then the inherent weakness of the chassis is irrelevant.

An old friend complained that if he picked up the SX-100 and dropped it 2", it would do a major jump in frequency, whereas other receivers would not. The cure is to not pick up and drop the SX-100. It is not the ideal mobile receiver, nor one to be used for narrow band cw during an earthquake.

Hallicrafters had some very competent engineers, and they solved the mechanical problem of the SX-100. Their solution was the SX-101. It is clear that they needed to add both depth and weight to solve the problem.

Consider the SX-100 as the Narrows Bridge (Galloping Gertie). The SX-101 was the replacement.

Very good condition, 6 piece Greenlee chassis punch set (NOT conduit punches), including a 1" square punch. 3/4" for 7-pin tubes and 1.25" for octal tubes included. All in original boxes, with very little use over the years. Very sharp. Rare chance to get a set of radio chassis punches.

Don't know about the power supply but the speaker appears to be the RCA speaker supplied for the AR-88 or possibly the AR-77 receivers. If so it should be about 4 ohms impedance and will require a matching transformer to work with the HRO.

Check the voltages and connections for the PS. It may be the guts of a rack mounted HRO supply.

A nice set of 1 KW P-P plug in coils, link coupled for 80 to 10 meters made
by EF Johnson and B&W (HDVL series):

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=1502&item=260210629518

Jackbars with plug in swinging links also available:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=1502&item=260210627481

I was saving these for that P-P 450TL rig I was going to build but I've
changed my mind.

73,
Chuck...

Tomas, top band sensitivity was a problem on many receivers of the
era. What I did to improve mine was to add an Ameco Nuvistor preamp.
It made a great difference. Mine had a built in power supply but some
versions didn't. They are still available used and I -think- Ameco
still makes them.

Those nuvistor preamps were really good for giving an old receiver some extra gain. The HQ-180 should have quite a bit of gain, even on the top band. It sounds like your unit needs a bit of work. I have had a 180 in the past, and even with no antenna, the internal noise is quite loud. It does become even louder when you connect the antenna. It could be alignment, replacing of the cathode bypass caps, a bias resistor that has drifted out of tolerance, a weak tube/tubes, etc.

Pete

I am looking for an old heathkit VF-1 VFO, working or non-working. Or,
if you happen to have a 80 meter CW crystal, FT-243 type I would be
interested in that. I also need one of the large black knobs for the
AT-1, I can email you a photo of this knob if you think you may have
one. It has been described as a "Collins Style" type knob, 1-3/4" dia
at the skirted bottom. Let me know if you might have one of these
items. Thanks & 73, Randy, W5KCM

Hi,

looking for these things:

]]]]]]]]]]]]]]]]]]]]]]]]]]]]]]]]]]

MANUALS:

1.)
T-408/URT-12, also called AN/URT-12
Military radio transmitter, Coast Guard

2.)
Conrac model CNA-8
8" black and white video monitor, tube kind

3.)
RCA model TM-9AN
8" black and white video monitor, tube kind

(#2 and #3 are very similar)

]]]]]]]]]]]]]]]]]]]]]]]]]]]]]]]]]]

ITEMS:

4.)
50 degree to 110 degree yokes fitting electromagnetic deflected CRTs that have a "small-shell duodecal base"

5.)
focus coils and magnet assemblied from old TV set CRTs that have a "small-shell duodecal base"

Referring to the base type of the CRTs is the best I can do to to indicate the diameter of the tube neck, which is about 1.5" The base socket has 12 positions (pins) but not all are used. Usually 6 are used, or 5, in the case of a magnetic focus CRT.

All the yokes and focus devices I am looking for refer to those used on black and white TV sets with this kind of CRT neck diameter. This is really old junque and much has been pitched if the original TV chassis was unserviceable, etc.

These are for a project where I want to operate a 10" electromagnetic deflection, magnetic focus CRT. There are a number of NOS CRTs having interesting phosphors, being from radar sets. Basically I saved them from the landfill, and want to put together a few unusual monochrome video monitors. Why stare at the boxes on a shelf??

For me, driving a yoke is trivial, but finding ones for these CRTs is a challenge.

I have a few 10SP4, which are 50 degree deflection, one 10UP14B, and some 10VP15 and 10VP47's -FAA spares.

]]]]]]]]]]]]]]]]]]]]]]]]]]]]]]]]]]

I can be reached at the reply-to (un-mung it..) or please find my contact info downscreen at www.bunkerofdoom.com

thanks,
Patrick

Browsing the tutorial on Variac repair, I came across the mention of Alumi-nu for welding aluminum. I can't find a web reference for it. an someone point me in the right direction?

Thanks

Bill

It worked fine for me, although I only tried a few pages of the
Westinghouse manual, and got sidetracked to some of the other great
stuff on the site, of which there is a huge amount.

Two thumbs up for the bunker of doom!

Regards,

John Byrns

I am 99% sure that he is talking about zinc brazing rod. It brazes (solders) aluminum without needing any flux, and makes a braze that is stronger than the aluminum(though much more brittle). The biggest problem with zinc brazing rod, is it has very few degrees between solid and fully molten. Because aluminum conducts heat so well, if any of the braze in the joint is molten, it all is. This prevents you from brazing in anything other than the horizontal (flat) position... the zinc will run out of the joint unless you use a dam to keep it in the joint.

Zinc brazing rod is available at any welding supply store.

-Chuck

That is pretty strange, concerning the "buy at your own risk", if you are in
Italy or Malta. I've got a friend that ships to Italy regularly, with no
problems so far.

     hi again guys,
     i'm still in the process of restoring my 180(see previous post).
i have a question re:same.  i'm trying to date the yr of prod.  no
paper on back of cabinet..i think it was repainted..very good job.
chassis has a stamped # on it.  6377.  another strange thing..all the
tube shields have 4 spring clips on the chassis to hold them.  it's a
real pain to pull the shields.  also has factory installed noise
blanker.  any ideas on date would be
     tnx, pete K2IQK

I learned something new today.  Never realized they used that type of
knob on the AT-1.
I've got quite a few of those.  Send me your pic and I'll go thru my
box and see if the size/style matches up.  I think these are the
standard Dakaware knobs.

I'll have to update it, thought it was correct. here it is:

wdxp@cox.net

Thanks for your kind help. I would like to see just what's involved in the 30m addition. At present am testing a remote tuning network that will tune all of 80m and all of 160m from inside the shack, was tired
of running outside and changing taps, etc. So far it's working fine, but for some reason it just won't tune 30 m. I called Hy Gain and they claim that using their LQ-160 base loading coil you can find a 30m and 60m tap point, but I've been unable to find it with my network, thus the request for the article. It uses a johnson rotary inductor from the junk box, and a vacuum relay plus some other stuff.

On a bad note, last night we had a freak severe windstorm that snapped one of the base insulators, and now the whole thing is lying against the eave of the house on about a 60 degree angle, so will have to dismantle it and try to come up with some kind of insulator, as Hy Gain changed the design of the whole base assembly (mine is circa 1960) and nothing they make now fits. I'm thinking of maybe turning something out of Fiberglass rod or some type of strong non-conducting material, and am open to suggestions Thanks for the article.

I've gone to QRZ,COM several times and their server is down, so
am unable to update the E-mail address. Do you know if they
shut things down during the night, as have tried at least 4 or 5 times
over the last few weeks and have never been able to get in.
Are they still in operation?

Hi Bill, I sent you an email with the photo of the knob. I believe I
have the knob coming now from another Ham in Iowa that is sending me
one. This knob as you say is a Dekaware type knob. If the one I get
doesnt look right I would like to get back to you. Thanks for helping.

This is a Westinghouse 3JP1A CRT complete with housing and shielding.
It was removed from working equipment over 20 years ago and has been
sitting on a shelf ever since. I have no way to test it, so I am
selling it as-is. Would be great for a scope clock or similar! These
had electrostatic deflection, and if I recall correctly the phosphor
is green. The CRT itself, inside the housing, is round, although the
faceplate of the mount makes it look rectangular.

This is an AEA Computer Patch RTTY Decoder Model CP-1, of
approximately 1983 vintage. Comes with original power supply. Has
switch for mod as per factory instructions for "high speed" (300
baud :P).

FS: I have the MD-239 Modulator that sits on the top left side of the T-368 military transmitter. It's in physically good condition and complete. It's a rare piece because most of them got separated from the original transmitter. I thought I had it sold to a guy but he never contacted me again. So I'm listing it here for $150.00. Located in College Station, TX. If interested you can call me at 979 696-4400.

You need a capacitance bridge to measure the dissipation factor. The by-pass and decoupling caps in the HQ-180 appear to be mostly disc ceramic caps. These have relatively low dissipation factor and are considered quite reliable but can go bad. Electrolytic caps, mostly used for power supply filter caps, at least in vacuum tube equipment, have relatively high dissipation factors when new but mainly fail when not used for some time. One plate of the capacitor is s chemical film which depends on the presense of a voltage to form so if not used for some time the thing simply stops being a capacitor.

Paper caps can actually be pretty good. If reasonably well sealed they have long lives. The notorious Black Beauty caps, as used in Hammarlund SP-600-JX receivers, had a manufacturing problem which caused them to be short lived. Actually, they were intended and sold to be long lived high performance caps and are found in all sorts of very high quality equipment. I suspect that moisture getting into the caps is the main cause of failures but they started getting a bad reputation not long after they began to be used so it might be something else.

Good paper type caps should have dissipation factors (at 1 khz) on the order of 0.01 or less and very low leakage types like ceramic, silver mica, and plastic (polyethylene, etc.) of perhaps 1/10th of this. Electrolytic caps will have dissipation factors much larger, however, they really should be measured with DC on them and some capacitor checkers allow for this.

My bet about the HQ-180 is that the power supply filter caps are sick.

Regarding front panels... Dee W4PNT  (Patty and Dee's Marine) does the
180A panel.  He's the guy who also does Valiants and Rangers.

Good info which explains 'why' old electro's should simply be replaced.

I've read that the paper was not all that high quality...contains acids which will inevitably break it down. Moisture is the main culprit, but only leads to breakdown sooner than later. Wax as a sealer was never going to have as long life as the other parts of the electronics in which these were installed.

> Good paper type caps should have dissipation factors (at 1 khz) on the order of 0.01 or less and very low leakage types like ceramic, silver mica, and plastic (polyethylene, etc.) of perhaps 1/10th of this. Electrolytic caps will have dissipation factors much larger, however, they really should be measured with DC on them and some capacitor checkers allow for this.

Conventional wisdom is that they'll leak sooner or later anyway. Better to shotgun them and be done with it. The wax will likely melt sooner or later, anyway.

OTOH, Chuck says there are no paper caps in the 180, so I'd defer to that.

> My bet about the HQ-180 is that the power supply filter caps are sick.
>

...and should be replaced. If they're not sick now, they could fail in spectacular (or not) fashion down the line. It's about the easiest thing to do...replace the filters. If they're not bad now, it's just one less thing to worry about.

I operate some vintage tube gear in which I've not replaced the filters; but I realize I'm sitting on a potential time bomb. First sign of a hum, I'm turning power off...which might be too late. Just because I don't follow my own advice (all the time) doesn't make it bad advice.

Electrolytics can have a very long life. Generally, they go bad slowly with an attendant drop in supply voltage and increase in hum. They rarely have catastrophic failures except after a long period of disuse when they become non-capacitors. Sometimes they can expode resulting in a bad smelling mess. This is pretty unusual. The power supply caps also act to by-pass some signals, especially audio, to ground. So one symptom of bad filter caps may be audio when the volume control is all the way down or noise or distortion.

I would not replace good caps simply beause they are old. As long as they are being used the film which constitutes one plate, will stay formed. Occasionally something will cause a short but, again, thats not too common.

Paper caps are all over the place. The old oil-filled ones were quite reliable and of high quality but were large. Most are high-voltage types. Unfortunately the dielectric oil used for many years turned out to be a form of PCB which is a cancer risk. These were sold with names like Pyranol, Dykanol, etc. Again, if you have some and they are not leaking, leave them alone. The main virtue of these oils was that they are not inflamable which was not true of the mineral and vegetable oils used previously.

Some tubular caps used a wax impregnant as the dielectric. Some were simply wax covered. Keep in mind that the latest of these guys is probably getting on toward half a century so its not surprizing that there are failures.

The Black Beauty caps found in a lot of 1950s equipment were intended to be deluxe, low leakage, long life types. For some reason they began to fail after only a few years. I think an improved version was made because some later equipment has caps that look the same but don't seem to fail early. Another type of capacitor was made by the same company under the name Orange Drop. These shared the same plastic impregnated paper dielectric but were equipped with dipped epoxy cases rather than the molded Bakelite cases of the Black Beauty types. Orange Drop caps seem to be quite reliable which leads me to think the problem wtih the BBs was the casing rather than some problem with the impregnant or paper. Of course, at this late date, I doubt if we will ever know.

Hammarlund got burned badly with the BB's which had to be replaced in thousands of military receivers so I think they avoided them afterward.

I just fixed up an HQ-145 of about the same vintage as the HQ-180 and my canned electrolytics, a triple section capacitor containing the two power supply filters and an audio capacitor failed the "smoke" test. I recapped those three caps. I did save the can in case I ever want to reinstall modern caps inside the can, but that seemed like an awful lot of work when even the most ardent collectors acknowledge that capacitor substitution should be done anyway in the interest of safety. Since small radio parts failed even when new and parts replacement was a normal activity (that's why there were so many radio/TV repairment around...where have they gone?) I guess this sort of restoration isn't quite as anal retensive as restoring Corvettes.

I thought a lot of "recap everything" was based on the assumption that some would fail, and once you're at it, you might as well do them all.

This is especially significant in things that would actually classify as boatanchors, since getting them open can often require quite a bit of work. Once you've done that to fix that one capacitor embedded way down in layers of shielding, changing the other capacitors at the time hardly adds much time to the effort. But if you don't simply change all the capacitors at that time, you're doomed to going through the disassembly process at some later point.

It actually seems to be the real collectors that drive the notion of keeping things intact. They want that original look, so they will stuff new capacitors in old cases, and print up new paper wrappers to put on new capacitors when that fits the situation. SOme will even decide that "keeping it original" is more important than using the thing, so they don't do anything to it, letting it sit on the shelf unused rather than do anything to it. But they are collecting, which is different from someone who wants an old radio to actually use.

Just got around to trying to put a KWM-2A I bought a few years back on the air. It's in roughish condition, but seems complete and usable. After replacing a failed diode in the power supply, it recieves fine.

I've been trying to transmit, and there seems to be a problem. It tunes up OK into my dummy load - the power meters in the dummy load indicate RF is flowing while it's in the LOCK mode. When I try to transmit using the PTT microphone that came with it, the relays clack when I key it, but...no RF out. I'm wondering if this is a common problem - anyone heard of it?

You have made a good start by cleaning the controls and doing some voltage checks.

I would NOT try to align it at this stage. That's one of the last things likely to be a serious problem, unless somebody gave the receiver to a child with a screwdriver.

I would definitely replace the electrolytic capacitors. They are the most failure-prone components in the radio. Until you are sure that the power supply is healthy, it's pointless to try diagnosing more specific problems.

In my HQ-180AC, which I restored and then sold a few years ago, I don't remember seeing any paper or plastic ("bumblebee") capacitors.

All of the small capacitors were ceramic or better, as I recall. Here is a photo of the chassis when I got the set. It's possible that someone had been there before me -- it has been a while.

http://www.antiqueradio.org/art/hamm04.jpg

In any case, I would not "shotgun" all of the small capacitors unless they are paper or plastic. Ceramics can fail, but they are generally much more reliable.

This article may help you identify different capacitor types: http://antiqueradio.org/recap.htm .

After you replace the electrolytics, you can try the set again, and if the problems persist, do more specific troubleshooting.

Regards,

Phil Nelson

The T/R relay contacts can be somewhat problematic. They get ugly, and you won't get the proper signals and voltages to the transmitter.

First, take a piece of 3x5 card stock, about 1/4 inch wide, and dip it in 99% isopropyl alcohol. Slide the card stock between each contact multiple times. The card stock should come out dirty, and it should not feel like it is going to tear. Do this first with the contacts in the Normally Open condition, and then activate the armature with your finger, and do the contacts that are Normally Closed.

If any of the contacts are rough, and tear at the card stock, they will need to be burnished (NEVER FILE OR SAND RELAY CONTACTS!). To make a simple burnisher, you need a grinder, and a piece of hardened sheet steel, an old hacksaw blade will do nicely. Grind the blade until it is 1/4 inch wide, and about as thick as the card stock. The final grind should be perpendicular to the length of the blade. The fine grinding marks in the steel do the burnishing. Put the tool between the contacts, and apply light pressure while moving the burnish tool in a file like manner. You are trying to maintain a crown on the contacts, so rock the tool, in various directions, to keep that crown (convex) shape.

If the contacts are too horrible to fix, you will have to replace the relay, which is quite a task if it is one of the wired in relays. The plugged in relays are a standard relay, with the exception of the 10,000 ohm relay coil. They are available from
Surplus Sales of Nebraska most of the time. Or, you can buy a new 24V relay, and steal swap its contacts into the old relay frame.

There are 3 relays, two under the chassis, and one in the HV cage.

If it tunes up in lock, all the relays are functioning (arguably) properly. You didn't say if the issue was transmission in CW, SSB, or both modes? That might direct things just a bit more. If the PTT function works OK, then I'd check the audio ckts up to the balanced modulator and the anti-VOX ckt. In CW, one needs to have the a key plugged in and in use. In SSB, its just the PTT ckt (and audio input)to bring it up.

Are you sure about that? I know the vast majority of caps in there are ceramic discs, but I recall some paper stuff as well in the detector stage.

The ceramics do fail sometimes too, but not very often. It's a major pain to find them when they do, though.

It has been a while since I was in one, but I am pretty sure.
There are some of those paper covered low voltage (3V?) electrolytics
in the audio section, IIRC.

Try swapping out V1 the first audio amp as half is used for the mike audio
and the other side is the tone oscillator. It is possible to to have rf out
on tune up, but nothing on ssb.

Also, there are a couple of low voltage electrolytics in the microphone
stage that are always bad after this much time.

I just checked the parts list for my HQ-180 (non-A model). It lists 3ea. 0.1uF, 200VDC and 3ea. 0.47uF, 400VDC "Dur-Paper" capacitors and a 0.033uF and 2ea. 0.01uF Mylar caps. All the rest of the small caps are ceramic and mica. Of course, the filters are electrolytics. --Ed

Hmm?  Maybe that is the difference between a plain and an "A" model?

Always amazes me sellers like this that are also trying to get more profit
off
the shipping cost.  That generator might only cost $10 to ship to a buyer
much
closer to the seller than, say, Nova Scotia.  Why not just use the shipping
calculator
and offer an HONEST shipping cost?   It can't weigh more than 5 pounds.
Such
a scheister!

He must think most people are just stupid.  But then again, he's not the
brightest
seller to grace eBay in recent years either.

Paul - do you think folks who understand what this stuff is are stupid? According to your ridiculously inflated-with-handling calculator, that stupid, useless meter would cost $45 to ship to me!!!! What an insulting rip-off you have going. If it even weighs 2 pounds I'd be surprised.

Nevermind the meter is not worth more than $5 in mint condition.

I have a suggestion: flog your dreck over at alt.test or rec.test - you'll probably get more takers there.

Oh, and be sure to let us know hour by hour that the auction is about to
end and we need to act now.

   Actually I thought it was mildly amusing. But on that same note, if
*we* are tired of hearing his opinions, why do you think *we* want to
hear your opinion on his opinion?

I have a nice NC-98 Receiver that has a couple of extra tubes mounted under
the chassis. Does anyone have any knowledge of modifications
to the National NC-98 that might involve adding a couple of extra tubes?
Thanks, Charlie Hugg, K5MBX

wow, i never expected to gt so many replies..i sent off for a bunch of
caps. that will be my first move. i figure after 40 yrs, the
electrolytics need changing anyway.  also the few paper caps.  i will
keep in touch after cap day.  tnx agn, pete k2iqk

Why don't you specify the tube types under there?

Too many people expect that the only mods or construction projects must derive from a magazine article. But there doesn't have to be an article about "Souping up your NC-98" in order for someone to modify it. They would figure out what needs improving, then pull circuits out of magazine articles or books. Maybe they'd follow some article about some other receiver, or maybe they'd treat the bits as modules and apply them to a different receiver.

Since the model doesn't jump out, it's bound to be a single conversion receiver with a 455KHz IF.

Which means that one possible modification would be a q-multiplier hanging off the plate of the mixer tube. Though, to be most effective one really ought to have an external regeneration control.

Or it might be a product detector, since the sort of receiver I imagine it is wouldn't have had a product detector. That would be tied to the output of the IF strip (and feeding the audio amplifier, though there's likely to be an external switch to move between it and the standard AM detector), and would require a signal from the BFO (assuming the receiver has a BFO).

Some cheap receivers never had a BFO, instead putting the IF stage into oscillation. I don't know whether that applies to your receiver, but if so, there's always the possiblity that someone added a real BFO.

Beyond that, you aren't likely to find anything standard. The sky's the limit on what individuals might think would improve a receiver, but a q-multiplier or a product detector are the only two really common things.

I was very pleased with the seller, personally. I didnt buy this, but I
have bought other things from him, and was very pleased with everything
about the transaction including communication, packing, speedy shipping,
etc. Market dictates price to some extent.

I dont particularly enjoy seeing so many auction ads here(or any sales
items, really..seems as if there should be a seperate board for that sort
of thing)

They're pretty accurate, though. There is little demand for VTVMs in this
day of cheap high-Z digital meters. Anybody in the Central Virginia area
who wants one, give me a ping and you can have a couple of them if you're
willing to pick them up. They'll need cal and both have aftermarket RF
probes.

Not offhand.  What tubes are they?  Is one of them a gas voltage reference?

The Osterman boatanchor book says this:

"The newer A model features a solid state PS, 230VAC, 3 position BFO,
accessory socket, less drift and 500 ohm line output."

Phil Nelson

I am glad you had such a pleasant experience with this seller. Most of
us here cannot afford the exorbitant shipping he charges for small items.
The starting bid and the buy it now seem to be very high for items of
questionable value, especially since most of them are not even working
and have been modified by a butcher (maybe the seller).

I have an Atlas 350XL with matching PS-350 Power Supply. Unit works good
with full 200W output, great condition, whats this thing worth?

No, I didn't, back then. It was a dog so I sold it at an OARA convention
and bought a 75A2 to modify.

Noise!
At 09:22 PM 4/26/96 -0500, JOHN_SEHRING.parti@ecunet.org wrote: >More on the Hallicrafters SX-100 > >Yes, the mechanical stability is touchy. But the chassis is simply not stiff enuf in the >right places around the whole front end. I plan to add some stiffeners to >see what can be done. One of my SX-100s has been the victim of a serious attempt to cure the mechanical instability and the changes do make it the most stable of the three I have. A previous owner used #12 solid wire to form bracing for the shield that separates sections of the tuning capacitors. Two wires run from the front of main tuning capacitor frame to the shield and to the rear of the capacitor frame. These are soldered at each connecting point. A third wire goes from the shield (attached in the area of the bandspread cap) back to the T-notch filter box. Getting this shield to hold still is a big step in the right direction, as evidenced by the superior stability of thie particular SX-100.

Late '60's Trio 9R-59D general coverage receiver. In very good
condition mechanically and electrically, recently aligned, and
receives very well. Dial calibration is dead on and I would say it's
damn close to collector quality. Listed as "very scarce" by Osterman.
Asking $200 shipped in US.

<fcathellATmsn.com> (replace AT with @)

Looks like this group has been mostely taken over by the ebay crowd as
a place to hawk their auctions than a place to discuss boatanchors.

>seems as if there should be a seperate board for that sort
> of thing)

There is, it is called rec.radio.swap. That is what the .swap groups
are for, but there are those in their eagerness to make a buck will
spam any group they think will get their auction noticed.

There was a great article in the ER for December 1994 that described
the electrical characteristics of quartz crystals. It had a very nice
diagram. Could someone take a look at that edition and just let me
know the name and call of the author? I'm writing something and would
like to make reference to this article.

Thanks!

Hi Steve,

Most of the time when a large download fails, it fails by not being complete. Check the file sizes. I would bet that the one that goes over your POTS line is truncated. The file server gets tired of waiting for an acknowledgment from Netscape, and goes on to other things. Netscape decides enough time has gone by, and declares the file downloaded... and lies about the number of bytes too! (I stopped using Netscape and went to Mozilla/Seamonkey for that very reason.)

RH6 is a bad place to stay with linux. Go over to Debian Stable, and you will do much better. It is just as fast, if you avoid the super fancy Gnome and KDE windowing features.

The problem with RH6 is it has serious problems in its kernel
that allow you to be rooted easily. It is the only version
of linux that I have ever used that got hacked. And then it
was hacked over a dialup line that was only up when I was
using the machine.

(see quoted material at end)
```

To all people reading this thread (see my comments way at the end):

I decided to still pursue this project. I have two XP boxes here (I really do not like XP and also for technical reasons), and fired one up on my dialup account, downloaded the tt4.pdf file (same one that failed everything else I said I did at the bottom of this post, way at end), and the version of AR I have is 7.0 (on this XP box) and it worked. Opened without errors or delay, and I looked all around at various locations in the manual. Thank you to the guys who put the website together and went to the trouble of making the files.

My version of what went wrong has to name as a candidate bugs in the software and software-hardware incompatibilities. I've had plenty of examples of this on about three dozen boxes I've owned and done extensive checking over the last 15+ years. PC compatibility is not 100%. Sometimes updates fix a problem on one piece of hardware and create a new problem on other pieces of hardware.

The only real problem with Linux is that you'd better have your firewall cranked up. One box I had got hacked. If you want to learn what you are up against, you need to get Ed Skoudis' book "Malware" and read that the hackers can _have you_ anytime they want. Its not a walk in the park.

Aye!

I'm on Debian Sarge and behind a hardware firewall (router) and had some
advanced mates have a real go at me.... she's rock solid!

Cheers,
--
Gregg

Just bought a Minimitter TOP-2-7 from ebay, has anyone got a schematic
or any other info? I've googled but found next to nothing.

http://cgi.ebay.co.uk/Minimitter-TOP-2-7-160m-80m-40m-AM-CW-Transmitter_W0QQitemZ230216611790QQihZ013QQcategoryZ4675QQssPageNameZWDVWQQrdZ1QQcmdZViewItem

A very nice AK #32 less tubes + Collins, Military TM's, Halli manuals can be see at:

http://search.ebay.com/_W0QQfgtpZ1QQfrppZ25QQsassZheytubeguy

I have additional antique radios (about 20 or so) that need new homes as a possible move

is in the very near future. Larger units will require something like UPS Store to do packing

and shipping. Stop by and take a look. Heytubeguy

Received a poorly packaged fine specimen this week of a DX-40 transmitter,
and yep, the meter is smashed all to heck.
Looking for anyone out there that might be able to provide me one.
Thanks!
Dave NS8S

This Cornell Dubilier Model TR-44 is similar to the CD-44/45 rotors. This one has been completely rebuilt, with new and additional bearings. It works great and comes with a black control box. It also comes with 85 feet of rotor cable (one 50ft section and one 35ft section) and a copy of the manual. This rotor is good for antennas with a maximum windload of 7.5 square feet. It uses 8-wire cable. It comes with the 4 mounting screws to mount the rotor inside a tower. It does not include the lower mast mounting

bracket. It also has the upper clamps to mount the top mast. Price is $125
plus shipping. Thanks, Charlie Hugg, K5MBX

Meter mvement busted? or just the outside case??

Hoyt could likely place a new movement in the old case

gb

Once more, it's longtime eBay fraudster Charlie Nudo of Drums, PA, spamming his unwanted dumpster findings in off-topic newsgroups. So far, he's had 29 Google Groups accounts banned due to this spamming activity, as well as threats of violence, divulging of personal information of his "enemies" and the like. Having this account banned will make it an even 30.

Take a second, copy his entire spam post including header, and send to:

abuse@frontiernet.net
groups-abuse@google.com

Be sure to indicate that the IP is from Frontier.net, which recently took over the old Epix.net IP blocks serving NE Pennsylvania from Dallas, PA.

Can you replace the vibrator in an AN/GRR-5 military receiver with a solid-state substitute?

I have heard a couple of different opinions.

Thanks.

Phil Nelson

I have become a proud owner of a vintage ARC-5. It seems un-modified, and is 7mhz unit.
Wonder if anyone can send me a schematic of a power supply, or just a wiring diagram of the power plug hook-up, because I have a nice, regulated 28VDC supply on hand. Would really love to copy some signals with this gem.
Dave NS8S
And....THANK YOU ALL

All,
I have a nice Johnson Viking Pacemaker transmitter, and am looking for a source for the 9-Pin round plug that is used for the accessory socket at the rear.
Loads of 8 and 11 pin units out there! Not able to find a 9 pin.
Thanks!
Dave NS8S

I am selling my Orion II.It comes with the internal ATU. It has all of the optional roofing filters for sharp and tight filtering.   It also has the 302R remote encoder. No microphone is included. I have been using it with the Heil PR40 mic. This rig has been lightly used and will come in the original shipping cartons, goody bag, etc. It is spotless and works perfectly. Price is $3600 plus shipping.
Thanks, Charlie Hugg, K5MBX

For Sale: Ameritron AL-1200

For Sale: Ameritron AL-1200 HF amplifier in as new condition. Full legal limit plus with a rugged 3CX1200A7 tube and Peter Dahl transformer. No dents, no scratches, no smoker with manual and box. Unit puts out Full Power with the original Eimac 3CX1200A7. This is a REAL Ameritron purchased before MFJ bought out Ameritron. It has seldom been used and shows it. It operates from 160 through 10 meters. It uses a class AB2 grounded grid circuit. CW, FM and RTTY efficiency is improved by shifting the bias deeper into class B. The heavy duty power supply and RF components, combined with a forced air system utilizing chimneys, provide long service life for expensive components. The AL-1200 is shipped factory wired for 240 volt, 50/60 Hz power mains. Cosmetically at least a 9 out of 10. No issues. Has been recently completely checked out by R.L. Howard and it meets all factory specs and then some. Price is $1900 plus shipping in 3 boxes. Digital pictures available upon request. Thanks, Charlie Hugg, K5MBX

I have to decided to part with some of my best Collins gear.
I have a CCA Excellent Collins 51S-1 Receive. I purchased it
years ago from the original owner in the Original Box with packing and the
cloth accessories bag. It also has the original manual. I still have the
box, manual,and accessories and bag. It is an early Winged Emblem version
with the white meter face. It works perfectly and I don't believe that it
has been used much at all. I have used it maybe 10 hours total over the
years. It still looks new. I can send pictures. Price is $2200 shipped in
lower 48. Thanks, Charlie Hugg, K5MBX CCA # 307

Dave,  Along with getting the schematic, you might want to consider
re-capping.  Its been my experience for the last number of years that
many of the multi-section caps have gone bad in this equipment.  I've
had to replace some burned resistors as a result simply firing the rig
up, as is.  The RCAF used ARC-5/SCR-274N gear up until contemporary
times and they re-did all their equipment. One can re-stuff the cans,
mount the small terminal strips where the cap was mounted, or simply
trace the wiring back to its origin and install any of several types of
small, modern caps.  If you don't want to re-cap out of hand and simply
want to fire it up, I'd recommend that you at least do so with a
variable DC supply.  That way you can bring things up slowly and see if
anything happens, untoward.  Ideally, you would run the filaments at the
rated 24-28 volts and use a variable B+ supply to bring it up.  Just a
thought that might save you some trouble.   de K3HVG

Hi -- I recently completed some repair work on a National NC-57. I did the typical replacement of electrolytics, out of tolerance resistors, etc. It was functioning reasonably well beforehand but was in need of some TLC. Following my repair work, I turned the unit on and am only receiving a hum with no RX. I conducted some resistance measurements at all tube sockets and every measurement was nominal (according to my NC-57 manual) except for pin 6 of tube 7 (6V6GT). The manual indicates a resistance reading of 380K ohms and I'm receiving around 50K ohms (same as pin 3 and pin 4). To be honest, I can't see how pin 6 should be 380K ohms. The output transformer primary shunt resistor is 22K ohms and everything is wired correctly at the tube socket. I double checked my work and carefully reviewed the schematics -- everything looks good. I'm really stumped here...

Any help would be greatly appreciated!

Chris, N4JOY

I would rate the unit between CCA excellent and very good. I am upgrading to
a B-5 and no longer require this round emblem. I paid $325 for it and will
sell it for same + UPS shipping.
Pix available.

You might want to do a search and discover the actual value of the original HP400. At the risk of demeaning your equipment, which I'm certainly not, they simply don't go for the amount posted. A more realistic valuation would serve you better. Regards de K3HVG

There is either a wiring error or a defective component. Pin 6 of the tube
socket is not used by the tube, so it is obviously used as a tie-point.
Trace in both directions from pin 6 and you should find the problem.

Hmmmmm... Are you certain that each tube is in it's correct socket?

Try it and see. I can't think why it wouldn't work, and the substitutes
are not all that expensive.

Call Antique Automobile Radio, Inc. at 800-933-4926 and ask them if they
have a vibrator sub that has been tested in the GRR-5.

I would suggest that you update your Acrobat Reader program. The
current version is 8.

Thank you for your reply. I just double checked each tube socket and
all tubes are installed correctly. You are right about pin 6 of 6V6GT
(tube 7) being used as a tie point. One end of a .1uf cap and 22K
resistor are soldered to pin 6 (the other end of the .1uf cap goes to
the tone switch). Pin 6 is also jumpered to pin 3, which then
connects to the speaker (output) transformer. Pin 4 has the other end
of the 22K resistor soldered and another lead to the speaker
transformer. There are also two wires leaving pin 4 of 6V6GT: one
goes to the reception switch and the other to the voltage regulator
(pin 4). I left the wiring alone during my repairs so either the
value of 380K ohms in the NC-57 chart is a typo (unlikely) or perhaps
the 6V6GT is defective?

I did try to inject a signal via the antenna connectors with my RF
signal generator... still no luck. I just have a slight hum and no
RX.

Hi -- the resistance of pin 6 to ground at 6V6 is 67.9K ohms. It
remains unchanged when the tube is removed.

Thanks,

Chris, N4JOY

Thank you for your reply. I just double checked each tube
socket and
all tubes are installed correctly. You are right about pin
6 of 6V6GT
(tube 7) being used as a tie point. One end of a .1uf cap
and 22K
resistor are soldered to pin 6 (the other end of the .1uf
cap goes to
the tone switch). Pin 6 is also jumpered to pin 3, which
then
connects to the speaker (output) transformer. Pin 4 has the
other end

of the 22K resistor soldered and another lead to the speaker
transformer. There are also two wires leaving pin 4 of
6V6GT: one
goes to the reception switch and the other to the voltage
regulator
(pin 4). I left the wiring alone during my repairs so
either the
value of 380K ohms in the NC-57 chart is a typo (unlikely)
or perhaps
the 6V6GT is defective?

I did try to inject a signal via the antenna connectors with
my RF
signal generator... still no luck. I just have a slight hum
and no
RX.

Thank you for your reply. I just double checked each tube
socket and

all tubes are installed correctly. You are right about pin
6 of 6V6GT
(tube 7) being used as a tie point. One end of a .1uf cap
and 22K
resistor are soldered to pin 6 (the other end of the .1uf
cap goes to
the tone switch). Pin 6 is also jumpered to pin 3, which
then
connects to the speaker (output) transformer. Pin 4 has the
other end
of the 22K resistor soldered and another lead to the speaker
transformer. There are also two wires leaving pin 4 of
6V6GT: one
goes to the reception switch and the other to the voltage
regulator
(pin 4). I left the wiring alone during my repairs so
either the
value of 380K ohms in the NC-57 chart is a typo (unlikely)
or perhaps
the 6V6GT is defective?

I did try to inject a signal via the antenna connectors with
my RF
signal generator... still no luck. I just have a slight hum
and no
RX.

Chris, N4JOY

The junction of the 0.1uf cap and 22K ohm resistor is at the plate of the tube. I hate to be obvious but are you counting the pins in the right direction?

The 22K resistor goes between plate and screen grid of the 6V6.

See if your hum changes with the volume control. The control is on the grid of the first audio tube and from that plate to the grid of the 6V6. If there is no change in hum level the problem is probably after the first audio, or nothing is getting to the grid. If the hum does change the problem is probably in the detector circuit somewhere. If you can try signal tracing the audio path.

My guess is that your eye keeps missing some miswired connection. That happens all the time. Perhaps you can get someone else to go over the stuff you replaced. Sometimes another person will spot a moved wire or short right away when you have struggled with it for hours.

All:

Is there anyone out there that has a copy of the June 78 QST? I would like a copy of the Product Review for the Kantronics 8040-B Receiver. I will pay all copy costs and postage involved. E-mail copy is fine also.

Thanks

Kevin

Kevin;

Check the QST cd that includes that year.

If there is no change in hum level the problem is probably after the first audio, or nothing is getting to the grid. If the hum does change the problem is probably in the detector circuit somewhere. If you can try signal tracing the audio path.

Since posting this I've discovered that there are two versions of the NC-57, the 57 and the 57B. They are not quite alike. The NC-57 that appears in the Sams Photofact booklet is the B version. Since that has socket resistance values and the National handbooks do not I assume that is what you have. The handbooks for both the NC-57 and the 57B are available on the BAMA site. One difference is the location of the volume control. In the B version the control is as I described, that is, at the grid of the first audio stage. In the first version it is at the grid of the output stage. If you have an original NC-57 and have been following the schematic in the Sams Photofact folder you may have been mislead in your wiring. Its certainly worth checking.

I appreciate everyone's suggestions. Per Richard's great advice, I verified that the NC-57 I own is indeed a NC-57B. Also, the slight hum does change in volume. However, I noticed that my 6SL7 (AF amp-BFO) was only slightly warm to the touch while the other tubes were obviously quite hot after several minutes. Perhaps I have a filament going out or the tube has failed. I'll replace the 6SL7 and update the group. Hopefully this will work!

Chris, N4JOY
